General Steps for Using the API

The basic steps for using the Spectrum™ Technology Platform API are:

1. Create a Server instance.
2. Set connection properties (connection type, host, port, etc.).
3. Connect to the Server.
4. Create a DataTable.
5. Add records to the DataTable.
6. Create a request message.
7. Set DataTable on the request message.
8. Get a service.
9. Send the request message to the Server.
10. Process the response message.
11. Disconnect from the Server.

Steps for Using the Client API

How Data is Passed to a Service

The following diagram illustrates how data is passed to a service through the API:

Message

Use the Message component to send your input data to the Spectrum™ Technology Platform service and receive output data from the service.

You can also use the Message component to override a service's default processing options. The default options for a service are set in Management Console. For example, the service `ValidateAddress` is capable of producing output in either mixed case or upper case. Let's say that in most instances, you need upper case output. However, one of your applications requires output in mixed case. In this situation, you would set the default for casing in the `ValidateAddress` service to upper case and override the default casing setting for that single application using the API. For those requests that should be handled according to the defaults you have specified, it is not necessary to provide any input options in your request.

The properties for Message include context properties, such as account ID, account password, service name, and service method; option properties, which are the service-specific runtime options; and error properties, which are the error class, error message, and error stacktrace.

DataTable

The DataTable component contains the records for your input and output data. Using the methods associated with this class, you define the column names for your output and add records to the data set. The Reset and Next methods are used to iterate over the results that are returned in a response from the server.

DataRow

The DataRow contains schema information and a list of data rows. Individual records reside in rows of data. For each output data row there are record-level qualifiers, field-level data, and field-level qualifiers.

Record-level qualifiers describe the processing of the record. Record-level qualifiers include status of the request (Success, Failure, or Error) and confidence in the accuracy of the output record.

Field-level data contains the validated, standardized, or enhanced record.

Field-level qualifiers include additional data about a given field. For example, the type of a Private Mailbox according to USPS categorization is a field-level qualifier.

Server

The Server component represents the Spectrum™ Technology Platform server. Using a Server component, you connect, disconnect, or access a specific service from the server.

Service

The Service component is used to process the message you're sending (i.e., send the input message and get back the response). The Service component has just one method: Process message.

Micro-Batch Processing

Micro-batch processing is a technique where you include more than one record in a single service request. By including multiple records in a request instead of issuing separate requests for each record, you can significantly improve performance when processing a large collection of records through a service. Spectrum™ Technology Platform supports micro-batch processing for REST and SOAP web services as well for the Client SDK.

Micro-Batch Size

There is no limit to the number of records you can include in a request, but in general you will see the best performance when sending between 50 and 100 records in a micro-batch. We recommend that you test micro-batches of various sizes to determine the optimal micro-batch size for your environment. Keep in mind that in some cases you may get multiple records in the response for each input record. For example, if you are performing address validation and include 10 addresses

in the micro-batch, and each address matches to two possible validated addresses, you would get 20 records in the response, not just 10.

Use caution when using both micro-batches and multiple threads for requests to Spectrum™ Technology Platform. Multiple threads can overwhelm the system if each thread's micro-batch size is too large.

Using a Record ID

You may find it helpful to assign an ID to each record in a micro-batch so that you can correlate the records in the request with the records returned in the response. Use user fields to do this.

Micro-Batch Processing in the Client API

To perform micro-batch processing in an API request to a service, send multiple data rows in the request. For example, this .NET class sends two rows in the request:

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Net;
using System.Text;
using ConsoleApplication1.ValidateAddress_Reference;

namespace Test
{
    class Program
    {
        static void Main(string[] args)
        {
            var validateClient = new ValidateAddress {Credentials = new
            NetworkCredential("admin", "admin")};

            var address1 = new input_portAddress
            {
                AddressLine1 = "1825B Kramer Lane",
                AddressLine2 = "Suite 100",
                PostalCode = "78758",
                City = "Austin",
                StateProvince = "Texas"
            };

            var address2 = new input_portAddress
            {
                AddressLine1 = "100 Congress",
                PostalCode = "78701",
                City = "Austin",
                StateProvince = "Texas"
            };

            var addresses = new input_portAddress[2];
```

```

        addresses[0] = address1;
        addresses[1] = address2;

        var options = new options {OutputCasing = OutputCasing.M};
        output_portAddress[] results =
validateClient.CallValidateAddress(options, addresses);

        for (int i = 0; i < results.Length; i++)
        {
            System.Console.WriteLine("Record " + (i+1) + ":");
            System.Console.WriteLine("AddressLine1=" +
results[i].AddressLine1);
            System.Console.WriteLine("City=" + results[i].City);
            System.Console.WriteLine("StateProvince=" +
results[i].StateProvince);
            System.Console.WriteLine("PostalCode=" +
results[i].PostalCode + "\n");
        }

        System.Console.Write("Press any key to continue...");
        System.Console.ReadKey();
    }
}
}

```

Tip: Do not disconnect between requests. Disconnecting and connecting can reduce performance.

Supported Compilers

The Spectrum™ Technology Platform Client SDK is supported with the following compiler and runtime minimum versions.

Java

Client SDK Package Directory: `clientSDK/platforms/java`

Client SDK requires the Java version 8. This is not installed with the Client SDK.

Windows 64-bit

- JDK: version 8
- C Compiler: MSVC 2005, MSVC 2008
- C++ Compiler: MSVC 2005, MSVC 2008

HP-UX RISC

- JDK: version 8

- C Compiler: cc: HP92453-01 A.11.01.21 HP C (Bundled) Compiler
- C++ Compiler: aCC: HP aC++ B3910B A.03.30 HP aC++ B3910B A.03.27

The clientSDK 64-bit lib is linked to these libraries:

- libpthread.1
- libnsl.1
- librt.2
- libdl.1
- libc.2
- libxti.2
- libdl.1

HP-UX Itanium

- JDK: version 8
- C Compiler: cc: HP aC++/ANSI C B3910B A.06.05
- C++ Compiler: aCC: HP aC++/ANSI C B3910B A.06.05

The clientSDK 64-bit lib is linked to the following libraries:

- libpthread.so.1
- libnsl.so.1
- librt.so.1
- libxti.so.1
- libdl.so.1

Red Hat (64-bit)

- Operating System: Red Hat Linux version 2.6.9-34.0.2.ELsmp
- C Compiler: gcc version 3.4.5
- C++ Compiler: g++ version 3.4.5

The clientSDK lib is linked to the following libraries:

- libstdc++.so.6
- libm.so.6
- libgcc_s.so.1
- libpthread.so.0
- libc.so.6
- ld-linux-x86-64.so.2

SuSE

- Operating System: SuSE SLES 11 and 12 (powered by UnitedLinux 1.0) (i586)\nKernel 2.4.21-295-smp (0).
- C Compiler: gcc version 3.2.2
- C++ Compiler: g++ version 3.2.2

Solaris

- Operating System: Solaris 5.11
- C Compiler: cc: Forte Developer 7 C 5.4 2002/03/09
- C++ Compiler: CC: Forte Developer 7 C++ 5.4 Patch 111715-16 2005/04/28

The clientSDK 64-bit lib is linked to the following libraries:

- libpthread.so.1
- libsocket.so.1
- libnsl.so.1
- librt.so.1
- libc.so.1
- libmp.so.2
- libmd5.so.1
- libscf.so.1
- libaio.so.1
- libdoor.so.1
- libuutil.so.1
- libm.so.2
- libc_psr.so.1
- libmd5_psr.so.1

AIX

- Operating System: AIX version 7.x
- C Compiler: xlc 6.0 Visual Age C 6.0
- C++ Compiler: xlc 6.0 Visual Age C++ 6.0

The clientSDK 64-bit lib are linked to the following libraries:

- libC.a
- libc_r.a
- libpthread.a
- librtl.a

Third-Party Libraries

The Spectrum™ Technology Platform API uses the following third-party libraries.

- Apache Commons Pool 1.6
- ICU 3.2.0
- Jakarta Commons HttpClient 3.1

- OpenSSL v1.0.2p
- OpenTop 1.5.3
- POCO 1.3

Network Protocols and Ports

The API communicates with the Spectrum™ Technology Platform server using HTTP, HTTPS, or SOCKET. Spectrum™ Technology Platform typically uses port 8080 to listen for HTTP requests and port 443 for HTTPS requests. HTTP and HTTPS features are also supported in the C, C++, COM, Java, and .NET APIs. .NET, Java, and COM APIs support Unicode; C and C++ APIs support both ASCII and Unicode.

In addition to HTTP, Spectrum™ Technology Platform supports a persistent SOCKET connection. The high-speed SOCKET connection provides much faster performance than traditional HTTP. Spectrum™ Technology Platform typically uses port 10119 to listen for SOCKET requests.

Using the Sample Applications

The Client SDK includes sample applications for all supported languages. The sample applications call a sample service on the Spectrum™ Technology Platform server which changes the casing of the input data to either upper case or lower case.

1. Copy the `casing-<version>.car` file from `ClientAPI\common\lib` to the `server\app\deploy` folder on the Spectrum™ Technology Platform server.

The casing service used by the sample applications is now deployed on your Spectrum™ Technology Platform server.

2. In the `ClientAPI\platforms` folder, find the `samples` subfolder for your platform and open the `readme.txt` file for further instructions on using the sample applications.

Note: You can modify the sample application to use one of the services you have licensed, and recompile the sample to run.

Using HTTPS

This procedure describes how to use HTTPS communication between your application and the Spectrum™ Technology Platform server.

1. Specify the root CA that will be used for communication between your application and the Spectrum™ Technology Platform server by doing one of the following:

Option	Description
If you do not know which root CA will be used	Copy the file <code>ca-bundle.pem</code> to your working directory. For C/C++ and COM, and ASP, the .pem file is located in the following folder in the location where you installed the Client SDK: Spectrum Client SDK\ClientAPI\platforms\windows\c-c++\<64>\<version>\lib\openssl For ASP, some examples of a working folder are: <ul style="list-style-type: none"> • If you use Internet Information Services to run ASP, copy <code>ca-bundle.pem</code> to the Windows system directory (for example, <code>C:\Windows\system64</code>). • If you use Internet Explorer to run ASP, copy <code>ca-bundle.pem</code> to the Internet Explorer default working directory (for example, <code>C:\Documents and Settings\<user>\Desktop</code>).
If you know which root CA will be used	Specify the root CA certificate in your CA bundle file.

2. In your application, when you connect to the server set the connection type to HTTPS.

Increasing the Timeout Value

If you experience timeouts between the client and server, you can increase the timeout value for the client.

- Use the `setConnectionProperty` method to set the timeout value.

2 - The C API

In this section

Introduction to the C API	17
Server	32
Service	36
Message	37
DataTable	51
DataRow	59

Introduction to the C API

The C API consists of the following structures:

- Server
- Service
- Message
- DataTable
- DataRow

Note: The C API is a C wrapper around the C++ code. On Unix you can use a C++ compiler to build your C application, which is the preferred approach. However, a C compiler can also be used directly on Linux, and Solaris. On HP-UX and AIX, you need to link all the C++ required libs when you use the C compiler. To do this, run `ldd ./batch` under `.... /samples/batch/bin/` to get the list of all dependent libs and put them in the link section of your makefile.

Supported Libraries

Spectrum™ Technology Platform provides an ASCII and Unicode version C API, while the Unicode version remains as compatible as possible with the original ASCII-version API design. Spectrum™ Technology Platform applies International Components for Unicode (ICU) in the API to support the Unicode feature. ICU is a mature, widely used set of C/C++ libraries for Unicode support and is developed by IBM.

The Unicode standard defines a default encoding based on 16-bit code units. This is supported in ICU by the definition of the `UChar` to be an unsigned 16-bit integer type (unsigned short *). This is the base type for character arrays for strings in ICU. Spectrum™ Technology Platform uses `UChar` as the Unicode string representation in our C API.

Note: Not all services support the full Unicode character set. For example, the `ValidateAddress` service supports the ISO 8859-1 character set for US input and international input and output, and the CP 850 character set for Canadian input and output. However, the Unicode libraries should be used whenever your input data may contain any non-ASCII character, even if the underlying service does not support the full Unicode character set.

For detailed information about `UChar`, please refer to the following two sites:

- icu.sourceforge.net/userguide
- www.ibm.com/software/globalization/icu

C Libraries Supported on Windows

Each API configuration produces library files with a common base name (g1client) but with a unique suffix and possibly prefix ("lib" in the case of static libraries). The library suffixes work like this:

```
<lib>g1client<S><U><D>.<lib|dll>
```

- lib—indicates a static library.
- dll—indicates a dynamic (shared) library.
- S—indicates a single-threaded build. If this is absent it indicates a multi-threaded build.
- U—indicates a UNICODE version build. If this is absent it indicates an ASCII build.
- D—indicates a debug build. If this suffix is absent it indicates an optimized release build.

To enable the UNICODE version, the LIB_UNICODE macro definition must be in your project.

To use the static C/C++ API library UNICODE version, you need to define U_STATIC_IMPLEMENTATION in your project.

To use the dynamic version, you need to define G1CLIENT_DLL in your project.

We also provide a file called "auto_link.h" in the header file directory and it automatically links to all the corresponding libraries according to the project settings.

To call 64-bit libraries in Windows, you need to define VER_64 in your project.

Static Library

Table 1: Single Threaded/Release

	ASCII	Unicode

C Libraries Supported on Unix

Each ClientSDK configuration produces library files with a common base name (libg1client) but with a unique suffix. Spectrum™ Technology Platform provides a multithread and release build for ASCII version and UNICODE version.

The library suffixes work like this:-

```
libg1client<U>.<so|sl|a>
```

Where U indicates a UNICODE version build. If this is absent it indicates an ASCII build.

To use the UNICODE version, you need to define LIB_UNICODE in your project.

In UNICODE Version C++ API, the namespace for all classes is g1client.

Constants

The C API uses two sets of constants. The first set is for the `Server` component, described in the table below.

Table 12: Constants for the `Server` Component

Constant Name	Description/Default	Example
SERVER_HOST	String for server host name. Default is "localhost".	65.89.200.89
SERVER_PORT	String for server port. Default is "8080".	10119
SERVER_ACCOUNT_ID	String for server account ID. No default value.	user1

Constant Name	Description/Default	Example
SERVER_ACCOUNT_PASSWORD	String for server account password. No default value.	user1
SERVER_CONNECTION_TIMEOUT	String for server connection timeout, in milliseconds. Default is "5000".	50000
SERVER_CONNECTION_TYPE	String for server connection type. Currently only supports HTTP, HTTPS, or SOCKET. Default is "HTTP".	HTTP(S)
SERVER_PROXY_HOST	String for proxy server host name. No default value.	192.168.1.77
SERVER_PROXY_PORT	String for proxy server port. No default value.	8080
SERVER_PROXY_USER	String for proxy server account ID. No default value.	user1
SERVER_PROXY_PASSWORD	String for proxy server account password. No default value.	user1

The second set of constants is for the `Message` component.

Table 13: Constants for the Message Component

Constant Name	Description	Example
MESSAGE_CONTEXT_ACCOUNT_ID	String for message context account ID.	user1
MESSAGE_CONTEXT_ACCOUNT_PASSWORD	String for message context account password.	user1

Constant Name	Description	Example
MESSAGE_CONTEXT_SERVICE_NAME	String for message context service name.	echoservice

Error Messages

Some functions return a `SUCCESSFUL_RETURN` or 0 (zero) value if they are successful. If it is not successful, the function returns an error code. In order to retrieve error messages, call `getErrorMessage(int errorCode)`. For example:

```
Server *server = NULL;
int nRet;
//Create Server
server = createServer();
//set the property to the server
...
//Connect to server
printf("Making connection to the server...\n");
nRet = serverConnect(server);
if(nRet != SUCCESSFUL_RETURN)
{
// ASCII Version-use the following code
printf(getErrorMessage(nRet));
//Unicode Version -use the following code
UChar * error = getErrorMessage(nRet);
// more code to print out the error message
return ;
}
```

The C API uses the following error messages.

- Error messages for passing a null structure:
 - "Input null DataRow"
 - "Input null DataTable"
 - "Input null Message"
 - "Input null Server"
- Error messages for connections:
 - "Connection type not supported"
 - "Client timeout"
 - "Blank connection property name"
 - "Blank property name"

- Error messages for creating DataTable:
 - "Blank column name"
 - "Duplicated column name"
- Error messages for MessagePackaging Exception:
 - "Input Message is null"
 - "Failed to connect to Server"
 - "Failed to disconnect from Server"
 - "Failed to open Http Connection"
 - "Failed to get Service"
 - "Failed to package the message using Serializer and Encoding"

Example Application

The sample code shown below illustrates how to use the ASCII version C API.

```
// Declarations
Server *server = NULL;
Message *request = NULL;
DataTable *dataTable = NULL;
Message *reply = NULL;
Service *service = NULL;
int nRet;
DataRow *row1 = NULL;
DataRow *row2 = NULL;
DataTable *returnDataTable= NULL;
char** columnNames;
DataRow** rows;
DataRow*dataRow;
int i;
int j;
char* value;

//Create Server
server = createServer();

//Set server connection properties
nRet = setConnectionProperty(server, SERVER_HOST, "localhost");
nRet = setConnectionProperty(server, SERVER_PORT, "10119 ");
nRet = setConnectionProperty(server, SERVER_CONNECTION_TYPE,"SOCKET");

if(reply)
nRet = deleteMessage(reply);
if(server)
nRet = deleteServer(server);
}

```

The sample code shown below illustrates how to use the Unicode version C API. The string here is represented by UChar*(or unsigned short*), which is 16-bit type to represent the Unicode string. ICU provides a function called `u_charsToUChars`, which converts 8-bit string to 16-bit string. The example here shows how to call Unicode version C API. The input string are all ASCII, so that we use `u_charsToUChars` to convert to 16-bit string. You could also construct Unicode string to directly pass in C API.

```

UChar* convertcharToUChar( char* name, UChar* value)
{
    int lenName= strlen(name);
    u_charsToUChars(name, value, lenName );
    value[ lenName]=0;
    return value;
}

// Declarations

```

```

Server *server = NULL;
Message *request = NULL;
DataTable *dataTable = NULL;
DataTable *returnDataTable= NULL;
Message *reply = NULL;
Service *service = NULL;
int nRet;

    }
}

//Free Memory
if(request)
nRet = deleteMessage(request);
if(reply)
nRet = deleteMessage(reply);
if(server)
nRet = deleteServer(server);

```

Server

The `Server` structure is used to connect to the server, disconnect from the server, and get the service from the server.

CreateServer

Creates the server.

Syntax

```
Server* createServer()
```

Parameters

None.

Result

The server is created.

Example

```

Server *server = NULL;
//Create Server
server = createServer();

```

DeleteServer

Deletes the server.

Syntax

```
int deleteServer(Server* server)
```

Parameters

- **Server**— the server to be deleted.

Result

Returns 0 (if successful) or error code.

Example

```
int nRet;
nRet = deleteServer(server);
```

SetConnectionProperty

Establishes the server connection configuration properties, such as host name and length of timeout.

Syntax

ASCII Version

```
int setConnectionProperty(Server* server, const char* name, const char*
value)
```

Unicode Version

```
int setConnectionProperty(Server* server, const UChar* name, const UChar*
value)
```

Parameters

- **Server** — the server to which the client connects
- **Name** — the name of the connection property, such as HOST
- **Value** — the value for the name of the connection property, such as "www.myhost.com"

Result

Returns 0 (if successful) or error code.

Example

ASCII Version

```
int nRet;
Server *server = NULL;
nRet = createServer(&server);
nRet = setConnectionProperty(server, SERVER_HOST,
"localhost");
```

Unicode Version

```
int nRet;
// construct 16-bit string
UChar serverHost[32];
char* SERVER_HOST= SERVER_HOST;
u_charsToUChars(SERVER_HOST, serverHost, strlen(SERVER_HOST));
serverHost [ strlen(SERVER_HOST)]=0;
// construct 16-bit string
UChar hostValue [32];
char* value= "localhost";
u_charsToUChars(value, hostValue, strlen(value));
hostValue[ strlen(value)]=0;
nRet = setConnectionProperty(server, serverHost , hostValue);
```

ServerConnect

Reads the properties to determine the configuration settings and makes a connection to the server.

Note: C uses the HTTP, HTTPS, or SOCKET server connection protocol. HTTP and HTTPS logically establish a client connection but do not actually connect to the server until a `GetService` or `Process` method is invoked. The SOCKET protocol establishes a connection to the server when `Connect` is invoked.

Syntax

```
int serverConnect(Server* server)
```

Parameters

- `Server`—the server to which the client connects

Results

Returns 0 (if successful) or error code.

Example

```
int nRet;  
nRet = serverConnect(server);
```

ServerDisconnect

Disconnects from the server.

Syntax

```
int serverDisconnect(Server* server)
```

Parameters

- Server—the server from which the client disconnects.

Results

Returns 0 (if successful) or error code.

Example

```
int nRet;  
nRet = serverDisconnect(server);
```

GetServiceFromServer

Gets the service from the server.

Syntax

ASCII Version

```
Service* getServiceFromServer(Server* server, const char* serviceName )
```

Unicode Version

```
Service* getServiceFromServer(Server* server, const UChar* serviceName
)
```

Parameters

- Server - server from which the client connects
- ServiceName - the name of service the client requests

Results

Service returned.

*Example***ASCII Version**

```
Server *server= NULL;
Service *service = NULL;
//Create Server
server = createServer();
...
// get Service From Server
service = getServiceFromServer(server, "ValidateAddress" );
```

Unicode Version

```
// construct 16-bit string
UChar serviceName[32];
char* sName="ValidateAddress";
u_charsToUChars(sName, serviceName, strlen(sName));
serviceName [ strlen(sName)]=0;
service = getServiceFromServer(server , serviceName );
```

Service

The `Service` structure is used to process the message (in other words, it sends the message to the server and receives a response from the server).

ProcessMessage

Processes the input message and retrieves the response message from the server.

Note: You will need to call `DeleteMessage()` to free memory when this returned message is no longer used.

Syntax

```
int processMessage (Service* service, Message* request, Message*
returnVal)
```

Parameters

- **Service**—the service the client requests.
- **Request**—the input message which contains the "option" setting and the dataset.
- **returnVal**—returns the response message from the server.

Results

Returns 0 (if successful) or error code.

Example

```
Message *request = NULL;
Message *reply = NULL;
int nRet;
...
// Assume that service is given here
// Create Input Message
request = createMessage();
... more code to fill dataTable information in request message
//Process Input Message, return output Message
nRet = processMessage(service, request, &reply);
if(nRet != SUCCESSFUL_RETURN)
{
printf("Error Occurred, " );
printf(getErrorMessage(nRet));
return ;
}
if(request)
nRet = deleteMessage(request);
if(reply)
nRet = deleteMessage(reply);
```

Message

The `Message` structure sends your input data and receives your output data from the service. The properties for `Message` include context properties, such as account ID, account password, service

name, and service method; option properties, which are the service-specific runtime options; and error properties, which are the error class, error message and error stacktrace.

CreateMessage

Creates a message.

Syntax

```
Message* createMessage()
```

Parameters

None.

Results

The message created.

Example

```
Message* request = NULL;  
request = createMessage();
```

DeleteMessage

Deletes the message.

Syntax

```
int deleteMessage(Message* message)
```

Parameters

- Message— the message to be deleted

Results

Returns 0 if successful or error code.

Example

```
int nRet = deleteMessage(message);
```

GetContext

Gets the value of the context entity identified by the name in the context session of the message. "Context" entities include the following constants: account ID, account password, service name, and service method.

Syntax

ASCII Version

```
const char* getContext(Message* message, const char* name)
```

Unicode Version

```
const UChar * getContext(Message* message, const UChar* name)
```

Parameters

- Message - the message to which this function applies
- Name - the name whose associated value is to be returned

Result

Returns the value for the name in the context entity. If the name does not exist, the method returns empty string.

Example

ASCII Version

```
const char* value = getContext(message, "account.id");
```

Unicode Version

```
UChar* value;
// construct 16-bit string
UChar accountID[32];
char* account="account.id";
u_charsToUChars(account, accountID, strlen(account));
accountID[ strlen(account) ]=0;
value = getContext(message, accountID);
```

GetContextMap

Gets the Map that contains all of the context entries.

Syntax

ASCII Version

```
MAP_STRING**getContextMap(Message* message)
Where the MAP_STRING is defined by
typedef struct map_string{
char* key;
char* value;
}MAP_STRING;
```

Unicode Version

```
MAP_STRING**getContextMap(Message* message)
Where the MAP_STRING is defined by
typedef struct map_string{
UChar* key;
UChar* value;
}MAP_STRING;
```

Parameters

- Message - the message to which this function applies

Results

Returns the array of MAP_STRING that contains all of the context entries.

Example

ASCII Version

```
int i;
char* name;
char* value;
MAP_STRING** mapping;
mapping = getContextMap( message);
i=0;
while(mapping[i] != NULL)
{
name= mapping[i]->key;
value = mapping[i]->value;
i++;
}
```

Unicode Version

```
int i;
UChar* name;
UChar* value;
MAP_STRING** mapping;
mapping = getContextMap( message);
```

```
i=0;
while(mapping[i] != NULL)
{
name= mapping[i]->key;
value = mapping[i]->value;
i++;
}
```

PutContext

Sets the value for the given name in the "context" properties. If there is an existing value present for the entity identified by the name, it is replaced. Context properties include the following constants: account ID, account password, service name, service key, and request ID.

Syntax

ASCII Version

```
int putContext(Message* message, const char* name,
const char* value)
```

Unicode Version

```
int putContext(Message* message, const UChar* name,
const UChar* value)
```

Parameters

- Message—message to which this function applies
- Name—name with which the specified value is to be associated
- Value—value to be associated with the specified name

Results

Returns 0 (if successful) or error code.

Example

ASCII Version

```
int nRet;
Message* message = createMessage();
nRet = putContext( message, "account.id", "user1") ;
```

Unicode Version

```
int nRet;
Message* message;
// construct 16-bit string
UChar accountID[32];
char* account="account.id";
UChar accountIDValue[32];
char* accountValue="user1";
u_charsToUChars(account, accountID, strlen(account));
accountID [ strlen(account)]=0;
u_charsToUChars(accountValue, accountIDValue, strlen(accountValue));
accountIDValue [ strlen(accountValue)]=0;
message = createMessage();
nRet = putContext( message, accountID, accountIDValue);
```

PutContextMap

Adds the new context properties to the current context properties.

Syntax

```
int putContextMap(Message* message, MAP_STRING** context)
```

Parameters

- Message - the message to which this function applies
- The new context map to be added to the current context map.

Results

Returns 0 (if successful) or error code.

Example

ASCII Version

```
MAP_STRING** mapping;
Message* message;
message = createMessage();
int nRet;
mapping = (MAP_STRING **)malloc(3 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = "key1" ;
mapping[0]->value = "value1" ;
mapping[1] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[1]->key = "key2" ;
mapping[1]->value = "value2" ;
```

```
mapping[2] = NULL;
nRet = putContextMap( message, mapping) ;
```

Unicode Version

```
MAP_STRING** mapping;
Message* message;
int nRet;
UChar key1[32];
char* key1String="key1";
UChar value1[32];
char* value1String="value1";

u_charsToUChars(key1String, key1, strlen(key1String));
key1[ strlen(key1String)]=0;
u_charsToUChars(value1String, value1, strlen(value1String));
value1[ strlen(value1String)]=0;

message = createMessage();
mapping = (MAP_STRING **)malloc(2 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = key1;
mapping[0]->value = value1 ;
mapping[1] = NULL;
nRet = putContextMap( message, mapping) ;
```

SetContextMap

Overwrites the current context properties with the new context properties.

Syntax

```
int setContextMap(Message* message, MAP_STRING** context)
```

Parameters

- Message - the message to which this function applies
- The new context map to be used to replace the current context map.

Results

Returns 0 (if successful) or error code.

Example

ASCII Version

```

MAP_STRING** mapping;
Message* message;
int nRet;
message = createMessage();
mapping = (MAP_STRING **)malloc(2 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = "key1" ;
mapping[0]->value = "value1" ;
mapping[1] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[1]->key = "key2" ;
mapping[1]->value = "value2" ;
mapping[2] = NULL;
nRet=setContextMap( message, mapping) ;

```

Unicode Version

```

MAP_STRING** mapping;
Message* message;
int nRet;
UChar key1[32];
char* key1String="key1";
UChar value1[32];
char* value1String="value1";
u_charsToUChars(key1String, key1, strlen(key1String));
key1[ strlen(key1String)]=0;
u_charsToUChars(value1String, value1, strlen(value1String));
value1[ strlen(value1String)]=0;
message = createMessage();
mapping = (MAP_STRING **)malloc(2 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = key1 ;
mapping[0]->value = value1 ;
mapping[1] = NULL;
nRet=setContextMap( message, mapping) ;

```

GetOption

Gets the value of the option entity identified by the name in the option session of the message. "Options" entities include the service-specific runtime options, such as output casing, output data format, and so on.

Syntax

ASCII Version

```
const char* getOption(Message* message, const char* name)
```

Unicode Version

```
const UChar* getOption(Message* message, const UChar* name)
```

Parameters

- Message - the message to which this function applies
- Name- the name whose associated value is to be returned

Results

Returns the value for the name in the "option" property in the message or an empty string if the name does not exist.

Example

ASCII Version

```
const char* value = getOption (message, " OutputCasing");
```

Unicode Version

```
UChar* value;
// construct 16-bit string
UChar option[32];
char* optionValue="OutputCasing";
u_charsToUChars(optionValue, option, strlen(optionValue));
option [ strlen(optionValue)]=0;
value = getOption(message, option);
```

GetOptions

Gets the map that contains all of the option entries.

Syntax

```
MAP_STRING** getOptions(Message* message)
```

Parameters

- Message—the message to which this function applies

Results

Returns the array of MAP_STRING that contains all of the context entries.

Example

ASCII Version

```

int i;
char* name;
char* value;
MAP_STRING** mapping;
mapping = getOptions( message);
i=0;
while(mapping[i] != NULL)
{
name= mapping[i]->key;
value = mapping[i]->value;
i++;
}

```

Unicode Version

```

int i;
UChar* name;
UChar* value;
MAP_STRING** mapping;
mapping = getOptions( message);
i=0;
while(mapping[i] != NULL)
{
name= mapping[i]->key;
value = mapping[i]->value;
i++;
}

```

PutOption

Sets the value for the given name in the "option" properties. If there is an existing value present for the entity identified by the name, it is replaced. Option properties are the service-specific run-time options.

Syntax

ASCII Version

```

int putOption(Message* message, const char* name,
const char* value)

```

Unicode Version

```
int putOption(Message* message, const UChar* name,
             const UChar* value)
```

Parameters

- Message - the message to which this function applies
- Name - with which the specified value is to be associated.
- Value - to be associated with the specified name.

Results

Returns 0 (if successful) or error code.

*Example***ASCII Version**

```
int nRet;
Message* message = createMessage();
nRet = putOption( message, "OutputCasing", "M");
```

Unicode Version

```
int nRet;
Message* message;
// construct 16-bit string
UChar option[32];
char* optionString="OutputCasing";

UChar optionValue[32];
char* optionValueString="M";

u_charsToUChars(optionString, option, strlen(optionString));
option[ strlen(optionString)]=0;

u_charsToUChars(optionValueString, optionValue,
strlen(optionValueString));
optionValue [ strlen(optionValueString)]=0;

message = createMessage();
nRet = putOption( message, option, optionValue);
```

PutOptions

Adds the new option properties to the current option properties.

Syntax

```
int putOptions(Message* message, MAP_STRING** context)
```

Parameters

- Message - the message to which this function applies
- The new option map to be added to the current option properties

Results

Returns 0 if successful or error code.

Example

ASCII Version

```
MAP_STRING** mapping;
Message* message;
message = createMessage();
int nRet;
mapping = (MAP_STRING **)malloc(3 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = "key1" ;
mapping[0]->value = "value1" ;
mapping[1] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[1]->key = "key2" ;
mapping[1]->value = "value2" ;
mapping[2] = NULL;
nRet = putOptions( message, mapping) ;
```

Unicode Version

```
MAP_STRING** mapping;
Message* message;
int nRet;
UChar key1[32];
char* key1String="key1";
UChar value1[32];
char* value1String="value1";
u_charsToUChars(key1String, key1, strlen(key1String));
key1[ strlen(key1String)]=0;
u_charsToUChars(value1String, value1, strlen(value1String));
value1[ strlen(value1String)]=0;
message = createMessage();
mapping = (MAP_STRING **)malloc(2 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = key1;
mapping[0]->value = value1 ;
mapping[1] = NULL;
nRet = putOptions ( message, mapping) ;
```

SetOptions

Overwrites the current option properties with the new option properties.

Syntax

```
int setOptions(Message* message, MAP_STRING** context)
```

Parameters

- Message - the message to which this function applies
- The new option map to be used to replace the current option map

Results

Returns 0 if successful or error code.

Example

ASCII Version

```
MAP_STRING** mapping;
Message* message;
int nRet;
message = createMessage();
mapping = (MAP_STRING **)malloc(3 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = "key1" ;
mapping[0]->value = "value1" ;
mapping[1] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[1]->key = "key2" ;
mapping[1]->value = "value2" ;
mapping[2] = NULL;
nRet=setOptions( message, mapping) ;
```

Unicode Version

```
MAP_STRING** mapping;
Message* message;
int nRet;
UChar key1[32];
char* key1String="key1";
UChar value1[32];
char* value1String="value1";
u_charsToUChars(key1String, key1, strlen(key1String));
key1[ strlen(key1String)]=0;
u_charsToUChars(value1String, value1, strlen(value1String));
value1[ strlen(value1String)]=0;
message = createMessage();
```

```
mapping = (MAP_STRING **)malloc(2 * sizeof(MAP_STRING *));
mapping[0] = (MAP_STRING *)malloc( sizeof(MAP_STRING));
mapping[0]->key = key1 ;
mapping[0]->value = value1 ;
mapping[1] = NULL;
nRet= setOptions ( message, mapping) ;
```

GetError

Gets the error message from the message.

Syntax

ASCII Version

```
const char* getError(Message* message )
```

Unicode Version

```
const UChar* getError(Message* message )
```

Parameters

- Message - the message to which this function applies

Result

Returns the error message in message.

Example

ASCII Version

```
const char* error = getError(message );
```

Unicode Version

```
const UChar* error = getError(message );
```

GetDataTable

Gets the DataTable in the message.

Syntax

```
DataTable* getDataTable(Message* message )
```

Parameters

- Message - the message to which this function applies

Example

```
// Assume that message is given here
DataTable *dataTable ;
dataTable = getDataTable( message );
```

DataTable

DataTable contains the records for the input and output data.

CreateDataTable

Create the DataTable.

Syntax

```
DataTable* createDataTable ()
```

Results

Returns the DataTable created.

Example

```
DataTable* dataTable;
dataTable = createDataTable ();
```

DeleteDataTable

Deletes the Data Table.

Syntax

```
int deleteDataTable(DataTable* dataTable)
```

Parameters

- **Datatable** - the DataTable to be deleted

Example

```
DataTable* dataTable;
dataTable = createDataTable();
...
if(dataTable) deleteDataTable(dataTable);
```

AddColumn

Adds the new column.

Syntax

ASCII Version

```
int addColumn(DataTable* dataTable, const char* columnName,
int* indexReturn)
```

Unicode Version

```
int addColumn(DataTable* dataTable, const UChar* columnName,
int* indexReturn)
```

Parameters

- **Datatable** - the DataTable to which this function applies
- **Column name** to be added to the DataTable
- Returns the corresponding index

Results

Returns 0 if successful or error code.

Exceptions

- Blank column name
- Duplicate column name

*Example***ASCII Version**

```
int nIndex;
int nRet;
nRet= addColumn( dataTable, "AddressLine1", &nIndex);
nRet= addColumn( dataTable, "City",&nIndex);
nRet= addColumn( dataTable, "State", &nIndex);
if(nRet != SUCCESSFUL_RETURN)
{
printf(getErrorMessage(nRet));
return ;
}
```

Unicode Version

```
int nRet;
int nIndex;
UChar* error;
UChar city[64];
char* cityString= "City"
u_charsToUChars(cityString, city, strlen(cityString));
city[ strlen(cityString)]=0;

nRet= addColumn( dataTable, city,&nIndex);
if(nRet != SUCCESSFUL_RETURN)
{
error = getErrorMessage(nRet);
//more code
}
```

GetColumnNames

Gets all the column names.

*Syntax***ASCII Version**

```
char** getColumnNames( dataTable )
```

Unicode Version

```
UChar** getColumnNames( dataTable )
```

Parameters

- `DataTable` - the `DataTable` to which this function applies

Results

Returns the array of column names.

Example

ASCII Version

```

char* value;
char** columnNames;
int i;
columnNames =getColumnNames ( dataTable) ;
for( i=0; i < getColumncount( dataTable); i++)
{
value = columnNames[i];
}

```

Unicode Version

```

UChar* value;
UChar** columnNames;
int i;
columnNames =getColumnNames ( dataTable) ;
for( i=0; i < getColumncount( dataTable); i++)
{
value = columnNames[i];
}

```

GetColumnIndex

Gets the corresponding column index.

Syntax

ASCII Version

```
int getColumnIndex(DataTable* dataTable ,const char* columnName)
```

Unicode Version

```
int getColumnIndex(DataTable* dataTable ,const UChar* columnName)
```

Parameters

- Datatable - the DataTable to which this function applies
- Column name

Results

Returns the corresponding column index.

Example

ASCII Version

```
int nIndex ;
nIndex = getColumnIndex(dataTable , "AddressLine1")
```

Unicode Version

```
int nIndex ;
UChar columnName[64];
char* columnNameStr= "AddressLine1" u_charsToUChars(columnNameStr,
columnName, strlen(columnNameStr));
columnName [strlen(columnNameStr)]=0;
nIndex = getColumnIndex(dataTable , columnName);
```

GetColumnCount

Gets the number of columns.

Syntax

```
int getColumnCount(DataTable* dataTable )
```

Parameters

- `DataTable` - the `DataTable` to which this function applies

Results

Returns the number of columns.

Example

```
// Assume that dataTable is given here int nColumnCount ;
nColumnCount = getColumnCount( dataTable ) ;
```

Clear

Clears the data in `DataTable`.

Syntax

```
int clear(DataTable* dataTable)
```

Parameters

- `DataTable` - the `DataTable` to which this function applies

Results

Returns 0 if successful or error code.

Example

```
// Assume that dataTable is given here
clear(dataTable);
```

GetDataRows

Gets an array of all `DataRow`s in the `DataTable`.

Syntax

```
DataRow** getDataRows(DataTable* dataTable)
```

Parameters

- `DataTable` - the `DataTable` to which this function applies

Results

Returns an array of `DataRow`s.

Example

```
// Assume that dataTable is given here
DataRow** rows;
DataRow* dataRow;
int i;
int j;
rows = getDataRows( dataTable);
for( i=0; i < getRowCount( dataTable); i++)
{
    dataRow = rows[i];

    for(j=0; j < getColumnCount( dataTable); j++)
    {
```

```

value = (char*)getByIndex( dataRow, j);
}
}

```

AddRow

Adds a DataRow to the DataTable.

Syntax

```
int addRow(DataTable* dataTable, DataRow* dataRow)
```

Parameter

- Datatable - the DataTable to which this function applies
- Datarow to be added to the DataTable

Results

Returns 0 if successful or error code.

Example

```

// Assume that dataTable is given here DataRow* newDataRow;
int nRet;
newDataRow = newRow( dataTable );
setByIndex (newDataRow, 0 , "10535 Boyer Blvd");
setByIndex (newDataRow, 1 , "Austin");
setByIndex (newDataRow, 2 , "Texas");
nRet = addRow( dataTable, newDataRow);

```

NewRow

Creates a new DataRow in the DataTable.

Syntax

```
DataRow* newRow(DataTable* dataTable )
```

Parameter

- Datatable - the DataTable to which this function applies

Results

Returns the new created DataRow.

Example

```
// Assume that dataTable is given here
DataRow* newRow;
int nRet;
newDataRow = newRow( dataTable );
setByIndex (newDataRow, 0 , "10535 Boyer Blvd");
setByIndex (newDataRow, 1 , "Austin");
setByIndex (newDataRow, 2 , "Texas");
nRet = addRow( dataTable, newRow);
```

GetRowCount

Gets the number of the DataRows in this DataTable.

Syntax

```
int getRowCount(DataTable* dataTable)
```

Parameter

- **Datatable** - the DataTable to which this function applies

Results

Returns the number of the DataRows in this DataTable.

Example

```
// Assume that dataTable is given here
int nRowCount ;
nRowCount = getRowCount( dataTable);
```

MergeDataTable

Merges the given DataTable and the current DataTable.

Syntax

```
int mergeDataTable(DataTable* dataTable ,DataTable* other )
```

Parameter

- DataTable - the DataTable to which this function applies
- Other DataTable to be merged with the current DataTable

Results

Returns 0 if successful or error code.

Example

```
// Assume that dataTable and otherDataTable are given here  
mergeDataTable (dataTable ,otherDataTableDataRow)
```

DataRow

DataRow contains the record for the input and output data.

CreateDataRow

Creates the DataRow.

Syntax

```
DataRow* createDataRow()
```

Results

Returns the DataRow created.

Example

```
DataRow* dataRow;  
dataRow = createDataRow();
```

DeleteDataRow

Deletes the DataRow.

Syntax

```
int deleteDataRow(DataRow* dataRow)
```

Parameter

- The DataRow to be deleted

Example

```
DataRow* dataRow;
dataRow = createDataRow();
...
if(dataRow)
    deleteDataRow (dataRow);
```

GetColumnNamesFromRow

Gets all the column names.

Syntax

ASCII Version

```
char** getColumnNamesFromRow(DataRow* dataRow)
```

Unicode Version

```
UChar** getColumnNamesFromRow(DataRow* dataRow)
```

Parameter

- Datarow - the DataRow to which this function applies

Results

Returns the array of column names.

Example

ASCII Version

```
char* value;
char** columnNames;
int i;
columnNames = getColumnNamesFromRow (dataRow) ;
for( i=0; i < getColumnCountFromRow (dataRow); i++)
{
```

```
value = columnNames[i];
}
```

Unicode Version

```
UChar* value;
UChar** columnNames;
int i;
columnNames = getColumnNamesFromRow (dataRow) ;
for( i=0; i < getColumnCountFromRow (dataRow); i++)
{
    value = columnNames[i];
}
```

GetColumnIndexFromRow

Gets the corresponding column index.

Syntax

ASCII Version

```
int getColumnIndexFromRow(DataRow* dataRow, const char* name)
```

Unicode Version

```
int getColumnIndexFromRow(DataRow* dataRow, const UChar* name)
```

Parameter

- DataRow - the DataRow to which this function applies
- Column name

Results

Returns the corresponding column index.

Example

ASCII Version

```
int nIndex
nIndex = getColumnIndexFromRow ("AddressLine1");
```

Unicode Version

```
int nIndex
UChar columnName[64];
```

```
char* columnNameStr= "AddressLine1"
u_charsToUChars(columnNameStr, columnName, strlen(columnNameStr));
columnName [strlen(columnNameStr)]=0;
nIndex = getColumnIndexFromRow (columnName);
```

GetColumnCountFromRow

Gets the number of columns.

Syntax

```
int getColumnCountFromRow(DataRow* dataRow )
```

Parameter

- DataRow - the DataRow to which this function applies

Results

Returns the number of columns.

Example

```
//Assume that the dataRow is given here
int nColumnCount ;
nColumnCount = getColumnCountFromRow (dataRow );
```

GetByIndex

Gets the value from the fields array by the column index in this DataRow.

Syntax

ASCII Version

```
const char* getByIndex(DataRow* dataRow, int index)
```

Unicode Version

```
const UChar* getByIndex(DataRow* dataRow, int index)
```

Parameter

- DataRow - the DataRow to which this function applies

- Index with which the specified value is to be associated.

Results

Returns the value for the column index in the DataRow, returns empty string if the index is invalid.

Example

ASCII Version

```
char* value = getByIndex( dataRow, 0);
```

Unicode Version

```
UChar* value = getByIndex( dataRow, 0);
```

GetByName

Gets the value from the fields array by the column name in this DataRow.

Syntax

ASCII Version

```
const char* getByName(DataRow* dataRow, const char* name )
```

Unicode Version

```
const UChar* getByName(DataRow* dataRow, const UChar* name )
```

Parameter

- Datarow - the DataRow to which this function applies
- Name with which the specified value is to be associated

Results

Returns the value for the column name in the DataRow, returns empty string if the column name does not exist.

Example

ASCII Version

```
char* value = getByName ( dataRow, "City")
```

Unicode Version

```

UChar* value;
UChar columnName[64];
char* columnNameStr= "City"
u_charsToUChars(columnNameStr, columnName, strlen(columnNameStr));
columnName [strlen(columnNameStr)]=0;
value = getByName ( dataRow, columnName);

```

MergeDataRow

Merges the given DataRow and the current DataRow.

Syntax

```
int mergeDataRow(DataRow* dataRow, DataRow* other)
```

Parameter

- Datarow - the DataRow to which this function applies
- Other DataRow to be merged with the current DataRow

Results

Returns 0 if successful or error code.

Example

```

//Assume that the dataRow and otherDataRow are given here
int nRet;
nRet= mergeDataRow(dataRow, otherDataRow);

```

SetByName

Sets the value for the corresponding column for the DataRow. If the value for the name exists, the old value is replaced.

*Syntax***ASCII Version**

```
int setByName(DataRow* dataRow, const char* name, const char* value)
```

Unicode Version

```
int setByName(DataRow* dataRow, const UChar* name, const
UChar* value)
```

Parameters

- DataRow - the DataRow to which this function applies
- Name with which the specified value is to be associated
- Value to be associated with the specified name

Exceptions

If input Blank column name or Duplicate column name, return error

Results

Returns 0 if successful or error code.

*Example***ASCII Version**

```
int nRet;
nRet= setByName (dataRow, "City", "Austin");
if(nRet != SUCCESSFUL_RETURN)
{ printf(getErrorMessage(nRet));
//more code
}
```

Unicode Version

```
int nRet;
UChar* error;
UChar columnName[64];
char* columnNameStr= "City"
UChar columnValue[64];
char* columnValueStr= "Austin";
u_charsToUChars(columnNameStr, columnName, strlen(columnNameStr));
columnName [strlen(columnNameStr)]=0;
u_charsToUChars(columnValueStr, columnValue, strlen(columnValueStr));
columnValue [strlen(columnValueStr)]=0;
nRet= setByName (dataRow, columnName, columnValue);
if(nRet != SUCCESSFUL_RETURN)
{ error = getErrorMessage(nRet);
//more code
}
```

SetByIndex

Sets the value for the corresponding column for the DataRow. If the value for the name exists, the old value is replaced.

Syntax

ASCII Version

```
int setByIndex(DataRow* dataRow, int index, const char* value)
```

Unicode Version

```
int setByIndex(DataRow* dataRow, int index, const UChar* value)
```

Parameters

- Datarow - the DataRow to which this function applies
- Column index with which the specified value is to be associated
- Value to be associated with the specified name

Exceptions

- The column index is invalid

Results

Returns 0 if successful or error code.

Example

ASCII Version

```
int nRet;
nRet= setByIndex (dataRow, 1, "Austin");
if(nRet != SUCCESSFUL_RETURN)
{
printf(getErrorMessage(nRet));
//more code
}
```

Unicode Version

```
int nRet;
UChar* error;
UChar columnValue[64];
char* columnValueStr= "Austin";
u_charsToUChars(columnValueStr, columnValue, strlen(columnValueStr));
```

```

columnValue [strlen(columnValueStr)]=0;
nRet= setByIndex (dataRow, 1, columnValue);
if(nRet != SUCCESSFUL_RETURN)
{
error = getErrorMessage (nRet);
//more code
}

```

AddChild

Adds a new DataRow to the named parent/child relationship. If the named relationship exists, the supplied DataRow will be appended to the existing DataRow collection. Otherwise, a new collection will be created with the supplied DataRow as its only element.

Syntax

ASCII Version

```

void addChild(DataRow* dataRow, const char* childName, DataRow*
childDataRow)

```

Unicode Version

```

void addChild(DataRow* dataRow, const UChar* childName, DataRow*
childDataRow)

```

Parameters

- The name of the parent/child relationship (e.g., "Flood Plain Data," "References," "Used By," and so forth)
- The DataRow to be added to the relationship

Example

ASCII Version

```

DataRow* dataRow = createDataRow();
DataRow* child1DataRow1 = createDataRow();

setByName(child1DataRow1, "City", "Austin");
setByName(child1DataRow1, "State", "Texas");

addChild( dataRow, "child1", child1DataRow1);

```

Unicode Version

```

UChar* convertcharToUChar( char* name, UChar* value)
{

```

```

int lenName= strlen(name);

u_charsToUChars(name, value, lenName );

value[ lenName]=0;
return value;
} >
DataRow* dataRow = createDataRow();
DataRow* child1DataRow1 = createDataRow();
UChar    name[128];
UChar    columnValue[128];
setByName(child1DataRow1, convertcharToUChar("City", name),
    convertcharToUChar("Austin", columnValue));
setByName(child1DataRow1, convertcharToUChar("State", name),
    convertcharToUChar("Texas", columnValue));
addChild( dataRow, "child1", child1DataRow1);

```

GetChildren

Retrieves the child rows from a named relationship.

Syntax

ASCII Version

```
DataRow** getChildren(DataRow* dataRow, const char* childName)
```

Unicode Version

```
DataRow** getChildren(DataRow* dataRow, const UChar* childName)
```

Parameters

- The name of the parent/child relationship, for example "Flood Plain Data", "References", "Used By", and so forth.

Results

Returns the child rows from the named relationship.

Example

ASCII Version

```
DataRow** child1Rows;
child1Rows = getChildren(dataRow, "child1");
```

Unicode Version

```
DataRow** child1Rows;
UChar childName[128];
/* see convertcharToUChar in the Example section of "addChild" */
child1Rows = getChildren(dataRow, convertcharToUChar("child1",
childName));
```

ListChildNames

Retrieves all of the names of the named parent/child relationships.

*Syntax***ASCII Version**

```
char** listChildNames(DataRow* dataRow)
```

Unicode Version

```
UChar** listChildNames(DataRow* dataRow)
```

Results

Returns the set of the names of the named parent/child relationships.

*Example***ASCII Version**

```
char** childsNames;
childsNames =listChildNames( dataRow);
```

Unicode Version

```
UChar** childsNames;
childsNames=listChildNames( dataRow);
```

SetChildren

Sets the rows of a supplied, named parent/child relationship. If rows previously existed under this name, they will be returned to the caller.

Syntax

ASCII Version

```
DataRow** setChildren(DataRow* dataRow, const char* childName, DataRow**
dataRows)
```

Unicode Version

```
DataRow** setChildren(DataRow* dataRow, const UChar* childName, DataRow**
dataRows)
```

Results

Returns the set of the names of the named parent/child relationships.

Example

ASCII Version

```
DataRow* dataRow = createDataRow();
DataRow* child1DataRow1 = createDataRow();
DataRow* child1DataRow2 = createDataRow();
DataRow* child2DataRow = createDataRow();
DataRow** child2Rows;
DataRow** returnRows;

setByName(child1DataRow1, "Address", "200 Congress");
setByName(child1DataRow1, "City", "Austin");

setByName(child1DataRow2, "Address", "100 Congress");
setByName(child1DataRow2, "City", "Dallas");

setByName(child2DataRow, "Address", "100 Congress");
setByName(child2DataRow, "City", "Austin");

addChild( dataRow, "child1", child1DataRow1);
addChild( dataRow, "child1", child1DataRow2);
addChild( dataRow, "child2", child2DataRow );

child2Rows=getChildren(dataRow, "child2");

returnRows=setChildren( dataRow, "child1", child2Rows);
```

Unicode Version

```
DataRow* dataRow = createDataRow();
DataRow* child1DataRow1 = createDataRow();
DataRow* child1DataRow2 = createDataRow();
DataRow* child2DataRow = createDataRow();
DataRow** child2Rows;
DataRow** returnRows;
UChar name[128];
```

```
UChar columnValue[128];
UChar childName[128];

setByName(child1DataRow1, convertcharToUChar("Address", name),
convertcharToUChar("200 Congress", columnValue));
setByName(child1DataRow1, convertcharToUChar("City", name),
convertcharToUChar("Austin", columnValue));
setByName(child1DataRow2, convertcharToUChar("Address", name),
convertcharToUChar("100 Congress", columnValue));
setByName(child1DataRow2, convertcharToUChar("City", name)
convertcharToUChar("Dallas", columnValue) );
setByName(child2DataRow, convertcharToUChar("Address", name),
convertcharToUChar("100 Congress", columnValue) );
setByName(child2DataRow, convertcharToUChar("City", name),
convertcharToUChar("Austin", columnValue) );

addChild( dataRow, convertcharToUChar("child1", childName),
child1DataRow1);
addChild( dataRow, convertcharToUChar("child1",
childName), child1DataRow2);
addChild( dataRow, convertcharToUChar("child2", childName), child2DataRow
);

child2Rows=getChildren( dataRow, convertcharToUChar("child2", childName));

returnRows=setChildren( dataRow, convertcharToUChar("child1", childName),
child2Rows);
```

3 - The C++ API

In this section

Introduction to the C++ API	73
Server	86
Service	90
Message	91
DataTable	101
DataRow	108

Introduction to the C++ API

The C++ API consists of the following classes:

- Server
- Service
- Message
- DataTable
- DataRow

UnicodeString in ICU is a string class that stores Unicode characters directly and provides similar functionality as the Java String and StringBuffer classes. The Spectrum™ Technology Platform Unicode C++ API uses this class to store Unicode strings.

Supported Libraries

Spectrum™ Technology Platform provides an ASCII and Unicode version C API, while the Unicode version remains as compatible as possible with the original ASCII-version API design. Spectrum™ Technology Platform applies International Components for Unicode (ICU) in the API to support the Unicode feature. ICU is a mature, widely used set of C/C++ libraries for Unicode support and is developed by IBM.

The Unicode standard defines a default encoding based on 16-bit code units. This is supported in ICU by the definition of the UChar to be an unsigned 16-bit integer type(unsigned short *). This is the base type for character arrays for strings in ICU. Spectrum™ Technology Platform uses UChar as the Unicode string representation in our C API.

Note: Not all services support the full Unicode character set. For example, the ValidateAddress service supports the ISO 8859-1 character set for US inputs and International inputs and outputs and the CP 850 character set for Canadian inputs and outputs. However, the Unicode libraries should be used whenever your input data may contain any non-ASCII character, even if the underlying service does not support the full Unicode character set.

For detailed information about UChar, please refer to the following two sites:

- icu.sourceforge.net/userguide/
- www-306.ibm.com/software/globalization/icu/index.jsp

Windows

Each API configuration produces library files with a common base name (g1client) but with a unique suffix and possibly prefix ("lib" in the case of static libraries). The library suffixes work like this:

<lib>g1client<S><U><D>.<lib|dll>

- lib—indicates a static library.
- dll—indicates a dynamic (shared) library.
- S—indicates a single-threaded build. If this is absent it indicates a multi-threaded build.
- U—indicates a UNICODE version build. If this is absent it indicates an ASCII build.
- D—indicates a debug build. If this suffix is absent it indicates an optimized release build.

To enable the UNICODE version, the LIB_UNICODE macro definition must be in your project.

To use the static C/C++ API library UNICODE version, you need to define U_STATIC_IMPLEMENTATION in your project.

To use the dynamic version, you need to define G1CLIENT_DLL in your project.

We also provide a file called "auto_link.h" in the header file directory and it automatically links to all the corresponding libraries according to the project settings.

To call 64-bit libraries in Windows, you need to define VER_64 in your project.

Static Library

Single Threaded/Release

	ASCII	Unicode

Unix

Each ClientSDK configuration produces library files with a common base name (libg1client) but with a unique suffix. Spectrum™ Technology Platform provides a multithread and release build for ASCII version and UNICODE version.

The library suffixes work like this:-

libg1client<U>.<so|sl|a>

- U—indicates a UNICODE version build. If this is absent it indicates an ASCII build.

To use the UNICODE version, you need to define LIB_UNICODE in your project.

In UNICODE Version C++ API, the namespace for all classes is g1client.

Constants

The C++ API uses two sets of constants. The first set is for the `Server` class described in the table below.

Table 14: Constants for the `Server` Component

Constant Name	Description/Default	Example
<code>Server::HOST</code>	String for server host name. Default is "localhost".	65.89.200.89
<code>Server::PORT</code>	String for server port. Default is "8080".	10119
<code>Server::ACCOUNT_ID</code>	String for server account ID. No default value.	user1
<code>Server::ACCOUNT_PASSWORD</code>	String for server account password. No default value.	user1
<code>Server::CONNECTION_TIMEOUT</code>	String for server connection timeout, in milliseconds. Default is "5000".	50000

Constant Name	Description/Default	Example
Server::CONNECTION_TYPE	String for server connection type. Currently only supports HTTP, HTTPS, or SOCKET. Default is "HTTP".	HTTP(S)
Server::PROXY_HOST	String for proxy server host name. No default value.	192.168.1.77
Server::PROXY_PORT	String for proxy server port. No default value.	8080
Server::PROXY_USER	String for proxy server account ID. No default value.	user1
Server::PROXY_PASSWORD	String for proxy server account password. No default value.	user1

The second set of constants is for the `Message` class:

Table 15: Constants for the `Message` Component

Constant Name	Description	Example
Message::CONTEXT_ACCOUNT_ID	String for message context account ID.	user1
Message::CONTEXT_ACCOUNT_PASSWORD	String for message context account password.	user1
Message::CONTEXT_SERVICE_NAME	String for message context service name.	echoservice

Error Messages

In order to get error messages, use the Exception class. Use the try/catch constructs to capture the error message. For example:

```
try{
    Server *server=new Server();

    //Connect to server
    server->connect();

}catch(Exception e)
{
    // ASCII Version-use the following code
    cout << "Error Occurs," << e.getErrorMessage();
    //Unicode Version -use the following code

    UnicodeString error = e.getErrorMessage() ;

    wcout << error.getTerminatedBuffer();
}
```

The C++ API uses the following error messages:

- Error Messages for Connection:
 - "Connection type not supported"
 - "Client timeout"
 - "Blank connection property name"
 - "Blank property name"
- Error Messages for creating DataTable:
 - "Blank column name"
 - "Duplicated column name"
 - "The column index is invalid"
- Error Messages for MessagePackaging Exception:
 - "Input Message is null"
 - "Failed to connect to Server"
 - "Failed to disconnect from Server"
 - "Failed to open Http Connection"
 - "Failed to get Service"
 - "Failed to package the message using Serializer and Encoding"

SmartPointer

Spectrum™ Technology Platform provides a class called SmartPointer that uses a simple form of reference counting to help track allocation of dynamic memory and perform memory management task.

For example:

```
SmartPointer<Server> server =new Server();
server.connect();
...
server.disconnect();
```

You do not need to delete the memory for pointer server. SmartPointer handles all memory management for you.

Example Application

The sample code shown below illustrates how to use the C++ ASCII version API.

```
try{

    //Create Server
    SmartPointer<Server> server =new Server();

    //Set server connection properties
    server->setConnectionProperty(Server::HOST, "localhost");
    server->setConnectionProperty(Server::PORT, "10119");
    server->setConnectionProperty(Server::CONNECTION_TYPE , "SOCKET");
    server->setConnectionProperty(Server::ACCOUNT_ID, "guest");
    server->setConnectionProperty(Server::ACCOUNT_PASSWORD, "");

    //Connect to server
    server->connect();

    //Get Service From Server
    SmartPointer<Service> service = server->getService("ValidateAddress");

    //Create Input Message
    SmartPointer<Message> request = new Message();

    //Fill DataTable in the input message
    SmartPointer<DataTable> dataTable = request->getDataTable();
    SmartPointer<DataRow> row1 = dataTable->newRow();
    row1->set("AddressLine1", "4200 Parliament Place") ;
```

```

row1->set("City", "Lanham");
row1->set("StateProvince", "Maryland");
dataTable->addRow(row1);

SmartPointer<DataRow> row2 = dataTable->newRow();
row2->set("AddressLine1", "100 Congress");
row2->set("City", "Austin");
row2->set("StateProvince", "Texas");
dataTable->addRow(row2);

//Set"option" Properties to the Input Message
request->putOption("OutputCasing", "M");
request->putOption("OutputRecordType", "A");

//Process Input Message, return output Message
SmartPointer<Message> reply = service->process(request);

//Disconnect from server
server->disconnect();

//Get the result from the response message
SmartPointer<DataTable> returnDataTable = reply->getDataTable();

vector<string> columnName = returnDataTable->getColumnNames();
vector< SmartPointer<DataRow> >::iterator iter =
returnDataTable->iterator();

for (int i=0; i< returnDataTable->getRowCount(); i++, iter++)
{
SmartPointer<DataRow> dataRow = *iter;

for (int col = 0; col < returnDataTable->getColumnCount(); col++)
{
const char* value = dataRow->get(columnName[col].c_str());
cout << value << "\n";
}
}
}catch(Exception e)
{
cout << "Error Occurred, " << e.getErrorMessage();
}
}

```

The sample code shown below illustrates how to use the C++ Unicode version API.

```

try{
//Create Server
SmartPointer<Server> server =new Server();

//Set server connection properties
server->setConnectionProperty(Server::HOST, "localhost");
server->setConnectionProperty(Server::PORT, "10119");

```

```

server->setConnectionProperty(Server::CONNECTION_TYPE , "SOCKET");
server->setConnectionProperty(Server::ACCOUNT_ID, "guest");
server->setConnectionProperty(Server::ACCOUNT_PASSWORD, "");

//Connect to server
server->connect();

//Get Service From Server
//NOTE: ValidateAddress does not support unicode, but supports
//characters in Canadian address and International address data files.

SmartPointer<Service> service = server->getService("ValidateAddress");

//Create Input Message
SmartPointer<Message> request = new Message();

//Fill DataTable in the input message
SmartPointer<DataTable> dataTable = request->getDataTable();
dataTable->addColumn("AddressLine1");
dataTable->addColumn("City");
dataTable->addColumn("PostalCode");
dataTable->addColumn("Country");

SmartPointer<DataRow> row1 = dataTable->newRow();

UnicodeString address1 = "74, Rue Octave Bénard";
row1->set( 0 , address1);
UnicodeString city1 = "Etang-Salé-les-Bains";
row1->set( 1 , city1);
UnicodeString postalCode1 = "97427";
row1->set( 2 , postalCode1);
UnicodeString country1 = "Reunion Island";
row1->set( 3 , country1);

dataTable->addRow(row1);

SmartPointer<DataRow> row2 = dataTable->newRow();
UnicodeString address2 = "Final Av. Panteón Foro Libertador";
row2->set( 0 , address2);
UnicodeString city2 = "Caracas";
row2->set( 1 , city2);
UnicodeString postalCode2 = "1010";
row2->set( 2 , postalCode2);
UnicodeString country2 = "Venezuela";
row2->set( 3 , country2);

dataTable->addRow(row2);

//Set "option" Properties to the Input Message
request->putOption("OutputCasing", "M");
request->putOption("OutputRecordType", "A");

```

```

//Process Input Message, return output Message
SmartPointer<Message> reply = service->process(request);

//Disconnect from server
server->disconnect();

//Get the result from the response message
SmartPointer<DataTable> returnDataTable = reply->getDataTable();

vector<UnicodeString> columnName = returnDataTable->getColumnNames();

vector< SmartPointer<DataRow> >::iterator iter = returnDataTable->iterator();

for (int i=0; i< returnDataTable->getRowCount(); i++, iter++)
{
SmartPointer<DataRow> dataRow = *iter;

for (int col = 0; col < returnDataTable->getColumnCount(); col++)
{
UnicodeString value = dataRow->get(columnName[col]);
wcout <<value.getTerminatedBuffer() <<"\n"; }
}

}catch(Exception e)
{
UnicodeString error = e.getErrorMesssage() ;

wcout << error.getTerminatedBuffer();
}

```

Server

The `Server` class is used to connect to the server, disconnect from the server, and get the service from the server.

Constructors

Constructors for the `Server` class are as follows:

- `Server()`

Destructor

The Destructor for the Server class is:

- ~Server()

Connect

Reads the properties to determine the configuration settings and makes a connection to the server. You can connect via HTTP, HTTPS, or SOCKET.

Note: C++ uses the HTTP, HTTPS, or SOCKET server connection protocol. HTTP and HTTPS logically establish a client connection but do not actually connect to the server until a `GetService` or `Process` method is invoked. The SOCKET protocol establishes a connection to the server when `Connect` is invoked.

Syntax

```
void connect()
```

Parameters

None.

Results

Establishes client connection to the server.

Example

```
//Create Server
SmartPointer<Server> server =new Server();

//Set server connection properties
server->setConnectionProperty(Server::HOST,"localhost");
server->setConnectionProperty(Server::PORT, "10119");
server->setConnectionProperty(Server::CONNECTION_TYPE , "SOCKET");
server->setConnectionProperty(Server::ACCOUNT_ID, "guest");
server->setConnectionProperty(Server::ACCOUNT_PASSWORD, "");

//Connect to server
server->connect();
```

Disconnect

Disconnects from the server.

Syntax

```
void disconnect()
```

Parameters

None.

Results

Client is disconnected from the server.

Example

```
SmartPointer<Server> server =new Server()  
server->connect();  
...  
server->disconnect();
```

SetConnectionProperty

Establishes the server connection configuration properties, such as host name and length of timeout.

Syntax

ASCII version:

```
void setConnectionProperty(const char* name, const char* value)
```

Unicode version:

```
void setConnectionProperty(const UnicodeString name, const UnicodeString  
value)
```

Parameters

- Name — the name of the connection property, such as HOST
- Value — the value for the name of the connection property, such as "www.myhost.com"

Results

The configuration properties for connection to the server are set.

Example

ASCII Version

```
SmartPointer<Server> server =new Server()
server->setConnectionProperty(Server::HOST,"localhost");
server->setConnectionProperty(Server::PORT, "8080");
```

Unicode Version

Same as ASCII, or:

```
SmartPointer<Server> server =new Server()
UnicodeString host="localhost";// Or input unicode string
server->setConnectionProperty(Server::HOST, host);
```

GetService

Gets the service from the server.

Note: See the Component Reference section of this guide for a list of services that may be available to you.

Syntax

ASCII Version:

```
SmartPointer<Service> getService(const char* serviceName)
```

Unicode Version:

```
SmartPointer<Service> getService(const UnicodeString serviceName)
```

Parameters

- Name of service

Results

Returns the specific service.

Example

ASCII Version

```
// Get Service From Server
SmartPointer<Service> service = server->getService("ValidateAddress");
```

Unicode Version

Same as ASCII, or:

```
// Get Service From Server
UnicodeString serviceName="ValidateAddress";// Or input unicode string
SmartPointer<Service> service = server->getService(serviceName);
```

Service

The `Service` class is used to process the message (i.e., send the message to the server and receive a response from the server).

Process

Processes the input message and returns the response message.

Syntax

```
SmartPointer<Message> process(Message* message)
```

Parameters

- Input message

Results

Returns the response message.

Example

```
SmartPointer<Message> reply = service->process(request);
```

Message

The `Message` class sends your input data and receives your output data from the service. The properties for `Message` include context entities, such as account ID, account password, service name, and service method; option entities, which are the Service-specific runtime options; and error entities, which are the error class, error message and error stacktrace.

Constructors

Constructors for the `Message` class are as follows:

- `Message()`

For example:

```
Message *request = new Message();
```

- `Message(const Message&)`

For example:

```
Message* request = new Message();  
Message anotherMessage = request;  
Message message(anotherMessage);
```

Destructor

The Destructor for the `Message` class is:

- `~Message();`

The following table summarizes the functions each method performs in the `Message` class.

Table 16: Message Methods Summary

Method	Function
getContext	Gets the value of the context entity identified by the name in the context session of the message.
getContext	Gets the Map that contains all of the context entries.
putContext	Sets the value of the context entity identified by the name in the context session of the message. If there is an existing value present for the entity identified by the name, it is replaced.
putContext	Adds the new context properties to the current context properties.
setContext	Overwrites the current context properties with the new context properties.
getOption	Gets the value of the option entity identified by the name in the option session of the message.
getOptions	Gets the Map that contains all of the option entries.
putOption	Sets the value of the option entity identified by the name in the option session of the message. If there is an existing value present for the entity identified by the name, it is replaced.
putOptions	Adds the new option properties to the current option properties.
setOptions	Overwrites the current option properties with the new option properties.

Method	Function
getError	Gets the error message.
getDataTable	Gets the DataTable from the message.

GetContext

Gets the value of the context entity identified by the name in the context session of the message.

Syntax

ASCII Version

```
const char* getContext(const char* name)
```

Unicode Version

```
const UnicodeString getContext(const UnicodeString name)
```

Parameters

- The name whose associated value is to be returned

Results

Returns the value for the name in the context entity. If the name does not exist, the method returns empty string.

Example

ASCII Version

```
const char* value= msg->getContext(Server::ACCOUNT_ID);
```

Unicode Version

Same as ASCII or:

```
UnicodeString name= Server::ACCOUNT_ID;// Or input unicode string
UnicodeString value= msg->getContext(name);
```

GetContext

Gets the Map that contains all of the context entries.

Syntax

ASCII Version

```
map<string , string> getContext()
```

Unicode Version

```
map< UnicodeString, UnicodeString > getContext()
```

Parameters

None.

Results

Returns the map that contains all of the context entries.

Example

ASCII Version

```
map<string , string> context = message->getContext();
```

Unicode Version

```
map< UnicodeString, UnicodeString > context = message->getContext();
```

PutContext

Sets the value for the given name in the context properties. If there is an existing value present for the entity identified by the name, it is replaced. Context properties include the following constants: account ID, account password, service name, service key, and request ID.

Syntax

ASCII Version

```
void putContext(const char* name, const char* value)
```

Unicode Version

```
void putContext(const UnicodeString name, const UnicodeString value)
```

Parameters

- Name with which the specified value is to be associated.
- Value to be associated with the specified name

*Example***ASCII Version**

```
message->putContext(Message.CONTEXT_ACCOUNT_ID, "user1");
```

Unicode Version

Same as ASCII or:

```
UnicodeString account="user1" ;// Or input unicode string
message->putContext(Message.CONTEXT_ACCOUNT_ID, account);
```

PutContext

Adds the new context properties to the current context properties.

*Syntax***ASCII Version**

```
void putContext(map<string , string> context)
```

Unicode Version

```
void putContext(map< UnicodeString, UnicodeString > context)
```

Parameters

- The new context map to be added to the current context map

*Example***ASCII Version**

```
map<string , string> context ;
//more code
message->putContext(context);
```

Unicode Version

```
map< UnicodeString, UnicodeString > context ;
//more code
message->putContext(context);
```

SetContext

Overwrites the current context properties with the new context properties.

*Syntax***ASCII Version**

```
void setContext(map<string , string> context)
```

Unicode Version

```
void setContext(map< UnicodeString, UnicodeString > context)
```

Parameters

- The new context map to be used to replace the current context map

*Example***ASCII Version**

```
map<string , string> context ;
//more code
message->setContext(context);
```

Unicode Version

```
map< UnicodeString, UnicodeString > context ;
//more code
message->setContext(context);
```

GetOption

Gets the value of the option entity identified by name in the option section of the message. Option entities include the service-specific runtime options, such as output casing, output data format, and so on.

Syntax

ASCII Version

```
const char* getOption(const char* name)
```

Unicode Version

```
const UnicodeString getOption(const UnicodeString name)
```

Parameters

- The name whose associated value is to be returned

Results

Returns the value for the name in the context entity. If the name does not exist, the method returns empty string.

Example

ASCII Version

```
const char* value = message->getOption("OutputCasing");
```

Unicode Version

Same as ASCII or:

```
UnicodeString option="OutputCasing"; // Or input unicode string
UnicodeString value= message->getOption(option);
```

GetOptions

Gets the map that contains all of the option entries.

Syntax

ASCII Version

```
map<string , string> getOptions()
```

Unicode Version

```
map< UnicodeString, UnicodeString > getOptions()
```

Parameters

None.

Results

Returns the map that contains all of the option entries.

Example

ASCII Version

```
const char* value = message->getOption("OutputCasing");
```

Unicode Version

```
UnicodeString option="OutputCasing"; //or input Unicode string
UnicodeString value= message->getOption(option);
```

PutOption

Sets the value for the given name in the option properties. If there is an existing value present for the entity identified by the name, it is replaced. Option properties are the service-specific run-time options.

Syntax

ASCII Version

```
void putOption(const char* name, const char* value)
```

Unicode Version

```
void putOption(const UnicodeString name, const UnicodeString value)
```

Parameters

- Name with which the specified value is to be associated
- Value to be associated with the specified name

Example

ASCII Version

```
message->putOption("OutputCasing", "M");
```

Unicode Version

Same as ASCII or:

```
UnicodeString option="M"; // Or input unicode string
message->putOption("OutputCasing", option);
```

PutOptions

Adds the new option properties to the current option properties.

Syntax

ASCII Version

```
void putOptions(map<string , string> options)
```

Unicode Version

```
void putOptions(map< UnicodeString, UnicodeString > options)
```

Parameters

- The new option map to be added to the current option properties

Example

ASCII Version

```
map<string , string> options ;  
//more code  
message->putOptions(options);
```

Unicode Version

```
map< UnicodeString, UnicodeString > options ;  
//more code  
message->putOptions(options);
```

SetOptions

Overwrites the current option properties with the new option properties.

Syntax

ASCII Version

```
void setOptions(map<string , string> options)
```

Unicode Version

```
void setOptions(map< UnicodeString, UnicodeString > options)
```

Parameters

- The new option map to be used to replace the current option map

Example

ASCII Version

```
map<string , string> options ;
//more code
message->setOptions(options);
```

Unicode Version

```
map< UnicodeString, UnicodeString > options ;
//more code
message->setOptions(options);
```

GetError

Gets the error message from the message.

Syntax

ASCII Version

```
string getError()
```

Unicode Version

```
UnicodeString getError()
```

Parameters

None.

Results

Returns the error message in message

Example

ASCII Version

```
String error = message->getError();
```

Unicode Version

```
UnicodeString error = message->getError();
```

GetDataTable

Gets the DataTable in the message.

Syntax

```
SmartPointer<DataTable> getDataTable()
```

Parameters

None.

Example

```
SmartPointer<DataTable> dataTable  
= message->getDataTable();
```

DataTable

DataTable contains the records for the input and output data.

Constructors

Constructors for the DataTable class are as follows:

- `DataTable()`

For example:

```
DataTable* dataTable = new DataTable()
```

Destructor

The Destructor for the DataTable class is:

- `~DataTable();`

The following table summarizes the functions each method performs in the DataTable class.

Table 17: DataTable Methods Summary

Method	Function
addColumn	Adds the new column.
getColumnNames	Gets all the column names.
getColumnIndex	Gets the corresponding column index.
getColumnCount	Gets the number of columns.
clear	Clears the data in DataTable.
iterator	An iterator that contains all DataRow's in the DataTable.
addRow	Adds a DataRow to the DataTable.
newRow	Creates a new DataRow in the DataTable.
getRowCount	Gets the number of the DataRow's in this DataTable.
merge	Merges the given DataTable and the current DataTable.

AddColumn

Adds the new column.

Syntax

ASCII Version

```
int addColumn(const char* columnName)
```

Unicode Version

```
int addColumn(const UnicodeString columnName)
```

Parameters

- Column name

Results

- Returns the index of column

Exceptions

- Blank column name
- Duplicate column name

*Example***ASCII Version**

```
SmartPointer<DataTable> dataTable = message.getDataTable();
dataTable->addColumn("Address");
dataTable->addColumn("City");
```

Unicode Version

Same as ASCII or:

```
SmartPointer<DataTable> dataTable = message.getDataTable();
UnicodeString columnName="Address"; // Or input unicode string
dataTable->addColumn(columnName);
```

GetColumnNames

Gets all the column names.

*Syntax***ASCII Version**

```
vector<string> getColumnNames();
```

Unicode Version

```
vector<UnicodeString> getColumnNames();
```

Parameters

None.

Results

Returns the vector of column names

Example

ASCII Version

```
vector<string> columnNames = dataTable->getColumnNames();
```

Unicode Version

```
vector<UnicodeString> columnNames = dataTable->getColumnNames();
```

GetColumnIndex

Gets the corresponding column index.

Syntax

ASCII Version

```
int getColumnIndex(const char* columnName)
```

Unicode Version

```
int getColumnIndex(const UnicodeString columnName)
```

Parameter

- Column name

Results

Returns the corresponding column index.

Example

ASCII Version

```
int columnIndex = dataTable->getColumnIndex ("City");
```

Unicode Version

Same as ASCII or:

```
UnicodeString columnName="City"; // Or input unicode string  
int columnIndex = dataTable->getColumnIndex (columnName);
```

GetColumnCount

Gets the number of columns.

Syntax

```
int getColumnCount()
```

Parameter

None.

Results

Returns the number of columns.

Example

```
int columnCount = dataTable->getColumnCount ();
```

Clear

Clears the data in DataTable.

Syntax

```
void clear()
```

Parameters

None.

Example

```
dataTable->clear ();
```

Iterator

An iterator that contains all DataRows in the DataTable.

Syntax

```
vector< SmartPointer<DataRow> >::iterator iterator()
```

Parameters

None.

Results

Returns an iterator that contains all DataRows in the DataTable.

Example

```
vector<string> columnName
= returnDataTable->getColumnNames();

vector< SmartPointer<DataRow> >::iterator theIterator
= returnDataTable->iterator();

for (int i=0; i< returnDataTable->getRowCount();
i++, theIterator++)
{
    SmartPointer<DataRow> dataRow = *theIterator;

    for (int col = 0;
col < returnDataTable->getColumnCount(); col++)
    {
        const char* value = dataRow->get(columnName[col].c_str());
    }
}
```

AddRow

Adds a DataRow to the DataTable.

Syntax

```
void addRow( SmartPointer<DataRow> dataRow)
```

Parameters

- DataRow to be added to the DataTable

Example

```
SmartPointer<DataRow> newRow = dataTable->newRow();
newRow->set( 0 , "10535 Boyer");
newRow->set( 1 , "Austin");
newRow->set( 2 , "Texas");
dataTable->addRow(newRow);
```

NewRow

Creates a new DataRow in the DataTable.

Syntax

```
SmartPointer<DataRow> newRow()
```

Results

Returns the new created DataRow

Example

```
SmartPointer<DataRow> newRow = dataTable->newRow();
newRow->set( 0 , "10535 Boyer");
newRow->set( 1 , "Austin");
newRow->set( 2 , "Texas");
dataTable->addRow(newRow);
```

GetRowCount

Gets the number of the DataRows in this DataTable.

Syntax

```
int getRowCount()
```

Results

Returns the number of the DataRows in this DataTable.

Example

```
int rowCount = dataTable->getRowCount();
```

Merge

Merges the given DataTable and the current DataTable.

Syntax

```
void merge(DataTable* other)
```

Parameters

- Other DataTable to be merged with the current DataTable

Example

```
DataTable* otherDataTable = new DataTable();  
dataTable->merge(otherDataTable);
```

DataRow

DataRow contains the record for the input and output data.

Constructor

Constructors for the DataRow class are as follows:

- DataRow ()

For example:

```
DataRow * dataRow = new DataRow();
```

- DataRow(const DataRow&)

For example:

```
DataRow* dataRow = new DataRow();
DataRow anotheDataRow = dataRow;
DataRow newDataRow(anotheDataRow);
```

Destructor

The Destructor for the DataRow class is:

- `~ DataRow();`

The following table summarizes the functions each method performs in the DataRow class.

Table 18: DataRow Methods Summary

Method	Function
getColumnNames	Gets all the column names.
getColumnIndex	Gets the corresponding column index.
getColumnCount	Gets the number of columns.
get	Gets the value from the fields array by the column index in this DataRow.
get	Gets the value from the fields array by the column name in this DataRow.
merge	Merges the given DataTable and the current DataTable.
set	Sets the value for the corresponding column name for the DataRow. If the value for the name exists, the old value is replaced.

Method	Function
set	Sets the value for the corresponding column index for the DataRow. If the value for the name exists, the old value is replaced.
addChild	Adds a new DataRow to the named parent/child relationship. If the named relationship exists, the supplied DataRow will be appended to the existing DataRow Collection, otherwise a new Collection will be created with the supplied DataRow as its only element.
getChildren	Retrieves the child rows from a named relationship.
listChildNames	Retrieves all of the names of the named parent/child relationships.
setChildren	Sets the rows of a supplied, named parent/child relationship. If rows previously existed under this name, they will be returned to the caller.

GetColumnNames

Gets all the column names.

Syntax

ASCII Version

```
vector<string> getColumnNames()
```

Unicode Version

```
vector<UnicodeString> getColumnNames()
```

Parameters

None.

Results

Returns the vector of column names

Example

ASCII Version

```
vector<string> columnNames = dataRow->getColumnNames();
```

Unicode Version

```
vector<UnicodeString> columnNames = dataRow->getColumnNames();
```

GetColumnIndex

Gets the corresponding column index.

Syntax

ASCII Version

```
int getColumnIndex(const char* columnName)
```

Unicode Version

```
int getColumnIndex(const UnicodeString columnName)
```

Parameter

- Column name

Results

Returns the corresponding column index.

Example

ASCII Version

```
int columnIndex = dataRow->getColumnIndex ("City");
```

Unicode Version

Same as ASCII or:

```
UnicodeString columnName="City"; // Or input unicode string
int columnIndex = dataRow->getColumnIndex (columnName);
```

GetColumnCount

Gets the number of columns.

Syntax

```
int getColumnCount()
```

Parameter

None.

Results

Returns the number of columns.

Example

```
int columnCount = dataRow->getColumnCount ();
```

Get

Gets the value from the fields array by the column index in this DataRow.

Syntax

ASCII Version

```
const char* get(int index)
```

Unicode Version

```
const UnicodeString get(int index)
```

Parameters

- Index with which the specified value is to be associated

Results

Returns the value for the column index in the DataRow, returns empty string if the index is invalid.

*Example***ASCII Version**

```
const char* value = dataRow->get(1);
```

Unicode Version

```
const UnicodeString value = dataRow->get(1);
```

Get

Gets the value from the fields array by the column name in this DataRow

*Syntax***ASCII Version**

```
const char* get(const char* columnName)
```

Unicode Version

```
const UnicodeString get(const UnicodeString columnName)
```

Parameters

- Name with which the specified value is to be associated

Results

Returns the value for the column name in the DataRow, returns empty string if the column name does not exist.

*Example***ASCII Version**

```
const char* value = dataRow->get("City");
```

Unicode Version

Same as ASCII, or:

```
UnicodeString columnName="City"; // Or input unicode string
const UnicodeString value = dataRow->get(columnName);
```

Merge

Merges the given DataRow and the current DataRow.

Syntax

```
void merge(DataRow* other)
```

Parameters

- Other DataRow to be merged with the current DataRow

Example

```
DataRow* otherDataRow = new DataRow();  
DataRow->merge(otherDataRow);
```

Set

Sets the value for the corresponding column for the DataRow. If the value for the name exists, the old value is replaced.

Syntax

ASCII Version

```
void set(const char* columnName, const char* value)
```

Unicode Version

```
void set(const UnicodeString columnName, const UnicodeString value)
```

Parameters

- Name with which the specified value is to be associated
- Value to be associated with the specified name

Exceptions

- Blank column name
- Duplicate column name

Example

ASCII Version

```
SmartPointer<DataRow> newRow = dataTable->newRow();
newRow->set( "AddressLine1" , "10535 Boyer");
newRow->set( "City" , "Austin");
newRow->set( "State" , "Texas");
```

Unicode Version

Same as ASCII or:

```
SmartPointer<DataRow> newRow = dataTable->newRow();
UnicodeString address="10535 Boyer"; // Or input unicode string
newRow->set( "AddressLine1" , address);
```

Set

Sets the value for the corresponding column for the DataRow. If the value for the name exists, the old value is replaced.

Syntax

ASCII Version

```
void set(int index, const char* value)
```

Unicode Version

```
void set(int index, const UnicodeString value)
```

Parameters

- Column index with which the specified value is to be associated
- Value to be associated with the specified name

Exceptions

- The column index is invalid.

Example

ASCII Version

```
SmartPointer<DataRow> newRow = dataTable->newRow();
newRow->set( 0 , "10535 Boyer");
newRow->set( 1 , "Austin");
newRow->set( 2 , "Texas");
```

Unicode Version

Same as ASCII or:

```
SmartPointer<DataRow> newRow = dataTable->newRow();
UnicodeString address="10535 Boyer"; // Or input unicode string
newRow->set( 0 , address);
```

AddChild

Adds a new DataRow to the named parent/child relationship. If the named relationship exists, the supplied DataRow will be appended to the existing DataRow collection. Otherwise, a new collection will be created with the supplied DataRow as its only element.

*Syntax***ASCII Version**

```
void addChild(const char* childName, SmartPointer<DataRow> childDataRow)
```

Unicode Version

```
void addChild(const UnicodeString childName, SmartPointer<DataRow>
childDataRow)
```

Parameters

- The name of the parent/child relationship (for example, "Flood Plain Data," "References," "Used By")
- The DataRow to be added to the relationship.

Example

```
SmartPointer<DataRow> childDataRow =new DataRow();
childDataRow ->set("Address", "100 Congress");
childDataRow ->set("City", "Austin");
SmartPointer<DataRow> dataRow =new DataRow();
dataRow->addChild("child1", childDataRow );
```

GetChildren

Retrieves the child rows from a named relationship.

Syntax

ASCII Version

```
list< SmartPointer<DataRow> > getChildren(const char* childName)
```

Unicode Version

```
list< SmartPointer<DataRow> > getChildren(const UnicodeString childName)
```

Parameters

- The name of the parent/child relationship, e.g. "Flood Plain Data", "References", "Used By", etc.

Results

Returns the child rows from the named relationship.

Example

```
list< SmartPointer<DataRow> > rowsChild2= dataRow-
>getChildren("child2");
```

ListChildNames

Retrieves all of the names of the named parent/child relationships.

Syntax

ASCII Version

```
list<string> listChildNames()
```

Unicode Version

```
list<UnicodeString> listChildNames()
```

Results

Returns the set of the names of the named parent/child relationships.

Example

```
list<G1CLIENT_STRING> names = dataRow->listChildNames();
```

SetChildren

Sets the rows of a supplied, named parent/child relationship. If rows previously existed under this name, they will be returned to the caller.

Syntax

ASCII Version

```
list< SmartPointer<DataRow> > setChildren(const char* childName, list<
    SmartPointer<DataRow> > dataRows)
```

Unicode Version

```
list< SmartPointer<DataRow> > setChildren(const UnicodeString childName,
    list< SmartPointer<DataRow> > dataRows)
```

Results

Returns the set of the names of the named parent/child relationships.

Example

```
SmartPointer<DataRow> dataRow1=new DataRow();
dataRow1->set("Address", "100 Congress");
dataRow1->set("City", "Austin");
SmartPointer<DataRow> dataRow2=new DataRow();
dataRow2->set("Address", "200 Congress");
dataRow2->set("City", "Austin");
list< SmartPointer<DataRow> > rows ;
rows.push_back(dataRow1);
rows.push_back(dataRow2);
list< SmartPointer<DataRow> > rowsNewChildren = dataRowSpt-
>setChildren("child1", rows);
```

4 - The Java API

In this section

Introduction	120
Server	124
Service	130
Message	131
DataTable	137
DataRow	142

Introduction

A Java class is a blueprint or prototype that defines the variables and methods common to all objects of a certain type. A Java class also defines the implementation of a particular kind of object. It is with these classes that you can create Java applications. In general, Java objects are created from Java classes.

A Java object is a collection of related variables and methods written in the Java language utilizing the Java Virtual Machine (JVM). The data associated with a class or object is stored in variables. The behavior associated with a class or object is implemented with methods. Methods are similar to the functions or procedures in procedural languages such as C.

Java software objects interact and communicate with each other using messages. Additional information that the receiving object may need to perform its task is passed by parameters.

For more information on Java technology, go to www.oracle.com/java.

Constants

The Java API uses two sets of constants. The first set is for the `Server` component, described in the table below.

Table 19: Constants for the `Server` Component

Constant Name	Description	Example
<code>Server.HOST</code>	String for server host name. Default is "localhost".	65.89.200.89
<code>Server.PORT</code>	String for server port. Default is "8080".	10119
<code>Server.ACCOUNT_ID</code>	String for server account ID. Default is null.	user1
<code>Server.ACCOUNT_PASSWORD</code>	String for server account password. Default is null.	user1
<code>Server.CONNECTION_TIMEOUT</code>	String for server connection timeout, in millisecond. Default is "10000".	50000

Constant Name	Description	Example
Server.CONNECTION_TYPE	String for server connection type. Currently only supports HTTP, HTTPS, or SOCKET. Default is "HTTP".	HTTP
Server.PROXY_HOST	String for proxy server host name. Default is null.	192.168.1.77
Server.PROXY_PORT	String for proxy server port. Default is null.	8080
Server.PROXY_USER	String for proxy server account ID. Default is null.	user1
Server.PROXY_PASSWORD	String for proxy server account password. Default is null.	user1
Server.INPUT_CLEANUP	<p>Boolean value to indicate if the special characters in the input data must be stripped. Default is false.</p> <p>Note: If this attribute is set to false and the input data includes special characters, an exception occurs.</p> <p>Important: Set this to true only if you are sure about the presence of special characters in the input data. Else, enabling this attribute impacts the performance negatively.</p>	true

The second set of constants is for the `Message` component.

Table 20: Constants for the `Message` Component

Constant Name	Description/Default	Example
Message.CONTEXT_ACCOUNT_ID	String for message context account ID.	user1
Message.CONTEXT_ACCOUNT_PASSWORD	String for message context account password.	user1 password.

Constant Name	Description/Default	Example
Message.CONTEXT_SERVICE_NAME	String for message context service name.	echoservice
Message.CONTEXT_SPECTRUM_DISPLAY_VERSION	String for message context Spectrum display version	12.1
Message.CONTEXT_SPECTRUM_SERVER_VERSION	String for message context Spectrum server version	12.1

Error Messages

The Java API uses the following error messages:

- Error Messages for Connection
 - "Connection type not supported."
 - "Client timeout"
- Error Messages for creating DataTable:
 - "Blank column name"
 - "Duplicated column name"
 - "Index is out of bounds"
- Error Messages for Message Packaging Exception
 - "Cannot pack null Message"
 - "Input Message is null"
 - "Unable to connect to Server:"
 - "Failed to get Service"
 - "Unknown serialization type:"
 - "Unknown encoding type:"
 - "Gateway is not connected" (for SOCKET)

Example Application

The sample code shown below illustrates how to use the Java API.

```
try
{
    // Create Server
    Server server = new Server();

    // Set server connection properties
    server.setConnectionProperty(Server.HOST, "localhost");
    server.setConnectionProperty(Server.PORT, "10119");
    server.setConnectionProperty(Server.CONNECTION_TYPE, "SOCKET");
    server.setConnectionProperty(Server.ACCOUNT_ID, "guest");
    server.setConnectionProperty(Server.ACCOUNT_PASSWORD, "");

    // Connect to server
    server.connect();

    // Get Service From Server
    Service service = server.getService("ValidateAddress");

    // Create Input Message
    Message request = new Message();

    // Fill DataTable in the input message
    DataTable dataTable = request.getDataTable();
    DataRow row1 = dataTable.newRow();
    row1.set("AddressLine1", "4200 Parliament Place");
    row1.set("City", "Lanham");
    row1.set("StateProvince", "Maryland");
    dataTable.addRow(row1);
    DataRow row2 = dataTable.newRow();
    row2.set("AddressLine1", "100 Congress");
    row2.set("City", "Austin");
    row2.set("StateProvince", "Texas");
    dataTable.addRow(row2);

    // Set "option" Properties to the Input
    Message request.putOption("OutputCasing", "M");
    request.putOption("OutputRecordType", "A");

    // Process Input Message, return output Message
    Message reply = service.process(request);

    // Disconnect from server
    server.disconnect();

    // Get the result from the response message
```

```

DataTable returnDataTable = reply.getDataTable();
String[] columnNames = returnDataTable.getColumnNames();
Iterator iter = returnDataTable.iterator();
while (iter.hasNext())
{
    DataRow row = (DataRow) iter.next();
    for (int col = 0; col < returnDataTable.getColumnCount();
col++)
    {
        String value = row.get(columnNames[col]);
        System.out.println(value);
    }
}
catch (Exception e)
{
    System.out.println("Error Occurred, " + e.getMessage());
}

```

Server

The `Server` class is used to connect to the server, disconnect from the server, and get the service from the server.

Connect

Reads the properties to determine which gateway connection to be used and makes a connection to the server. You can connect via HTTP, HTTPS, or SOCKET. However, HTTP and HTTPS do not actually connect to the server until a `GetService` or `Process` method is invoked. With a SOCKET connection type, the `Connect` method is fully functional.

Syntax

```
public void connect()
```

Parameters

None.

Results

Throws:

- **ConfigurationException**: When invalid configuration causes the inability to connect to the server. For example, an unknown protocol would cause a **ConfigurationException**. There is no value in attempting to `retryConnect()` when this error occurs.
- **ConnectionException**: When unable to connect to the server. It might be possible to reconnect, depending on the underlying cause of the exception.
- **MessageProcessingException**: When an error occurs on the server that is not due to **ConfigurationException** or **Connection** issues.

Example

```
Server server = new Server();

server.setConnectionProperty(Server.HOST, "localhost");
server.setConnectionProperty(Server.PORT, "10119");
server.setConnectionProperty(Server.CONNECTION_TYPE, "SOCKET");
server.setConnectionProperty(Server.ACCOUNT_ID, "guest");
server.setConnectionProperty(Server.ACCOUNT_PASSWORD, "");

try
{
    //Connect to server
    server.connect();
}
catch (ConfigurationException e)
{
    // indicate an error with configuration
}
catch (ConnectionException e)
{
    // handle connection issue (retry, report error, etc.)
}
catch (MessageProcessingException e)
{
    // report error
}
```

Connection Pooling

Connection pooling for the **SOCKET** connection type is available to the Java client. This section describes how to enable and disable connection pooling. By default connection pooling is disabled.

To enable connection pooling:

```
Server server = new Server();
Server.setConnectionProperty(Connection.SOCKET_POOL, "true");
```

To disable connection pooling:

```
Server server = new Server();
Server.setConnectionProperty(Connection.SOCKET_POOL, "false");
```

When connection pooling is enabled, the `connect()` method borrows a connection from the pool, and the `disconnect()` method returns the connection back to the pool. When pooling, the client must call `disconnect()` each time to return the connection to the pool.

Each thread should contain its own server, as shown in the following example:

```
{
    ...
    Server server = new Server();
    server.setConnectionProperty(Server.HOST, "localhost");
    server.setConnectionProperty(Server.PORT, "10119");
    server.setConnectionProperty(Server.CONNECTION_TYPE, "SOCKET");
    server.setConnectionProperty(Server.ACCOUNT_ID, "yourID");
    server.setConnectionProperty(Server.ACCOUNT_PASSWORD, "pwd");
    server.setConnectionProperty(Connection.SOCKET_POOL, "true");
    server.setConnectionProperty(Connection.SOCKET_POOL_MAX_ACTIVE, "20");

    server.setConnectionProperty(Connection.SOCKET_POOL_MIN_IDLE, "10");
    server.setConnectionProperty(Connection.SOCKET_POOL_MAX_TOTAL, "25");

    server.connect();
    ...
    service = server.getService(serviceName);
    reply = service.process(requestMessage);
    server.disconnect();
    ...
}
```

The following table lists the constants you can use for connection pooling.

Table 21: Constants for Connection Pooling

Constant Name	Description
SOCKET_POOL	Whether or not to use connection pooling if using the SOCKET connection type. Values are true or false. Default is false.
SOCKET_POOL_MAX_ACTIVE*	Maximum number of active socket connections that may be borrowed from the pool. Default is -1, which indicates no maximum.
SOCKET_POOL_MAX_IDLE*	Maximum number of idle socket connections remaining in the pool. Default is -1, which indicates no maximum.

Constant Name	Description
SOCKET_POOL_MAX_TOTAL*	Maximum total number of pooled socket connections (both active and idle). Default is -1, which indicates no maximum.
SOCKET_POOL_MAX_WAIT*	Maximum amount of time (in milliseconds) to wait before throwing an exception when the pool is exhausted and the "when exhausted" action is WHEN_EXHAUSTED_BLOCK. Default is -1, which indicates no maximum.
SOCKET_POOL_MIN_EVICTABLE_IDLE_TIME_MILLIS*	Minimum amount of time a connection may sit idle in the pool before it is eligible for eviction. Default is 1800000 (30 minutes).
SOCKET_POOL_MIN_IDLE*	Minimum number of connections allowed in the pool before the evictor thread (if active) creates new connections. The default is 0.
SOCKET_POOL_NUM_TESTS_PER_EVICTION_RUN*	Sets the number of idle connections to examine during each run of the evictor thread (if active). Default is -1, which indicates all idle connections are examined.
SOCKET_POOL_TEST_ON_BORROW*	Whether connections will be validated before being borrowed from the pool. Default is true.
SOCKET_POOL_TEST_ON_RETURN*	Whether connections will be validated before being returned to the pool. Default is false.
SOCKET_POOL_TEST_WHILE_IDLE*	Whether connections will be validated by the idle connection eviction thread. Default is false.
SOCKET_POOL_TIME_BETWEEN_EVICTION_RUNS_MILLIS*	Sets the number of milliseconds to sleep between runs of the idle connection evictor thread. When set to zero or a negative number, no idle connection evictor thread will be run. Default is 300000 (5 minutes).

Constant Name	Description
SOCKET_POOL_WHEN_EXHAUSTED_ACTION*	Sets the "when exhausted action" to take when attempting to borrow a connection and none are available. Default is SOCKET_POOL_WHEN_EXHAUSTED_BLOCK.
SOCKET_POOL_WHEN_EXHAUSTED_BLOCK*	A "when exhausted action" type indicating that when attempting to borrow a connection and none are available, the caller should block until a new object is available, or the maximum wait time has elapsed.
SOCKET_POOL_WHEN_EXHAUSTED_FAIL*	A "when exhausted action" type indicating that when attempting to borrow a connection and none are available, the caller should fail, throwing a ConnectionException.
SOCKET_POOL_WHEN_EXHAUSTED_GROW*	A "when exhausted action" type indicating that when attempting to borrow a connection and none are available, a new connection will be made anyway.

* Applicable only if using the SOCKET connection type and connection pooling is enabled.

Disconnect

Disconnects from the server.

Syntax

```
public void disconnect()
```

Parameters

None.

Results

Client is disconnected from the server.

Example

```
...
//Disconnect from server
server.disconnect();
```

SetConnectionProperty

Establishes the server connection configuration properties, such as host name and length of timeout.

Syntax

```
public void setConnectionProperty(String name, String value)
```

Parameters

- Name — the name of the connection property, such as HOST
- Value — the value for the name of the connection property, such as "www.myhost.com"

Results

None.

Exceptions

- ERROR-INVALID-COLUMN_NAME — an empty or null column name.
- ERROR_INVALID_VALUE — A null value.

Example

```
Server server = new Server();

server.setConnectionProperty(Server.HOST, "localhost");
server.setConnectionProperty(Server.PORT, "8080");

//Connect to server
server.connect();
```

GetService

Gets the service from the server.

Syntax

```
public Service getService(String serviceName)
```

Parameters

- Name - the name of the service

Results

Returns the specific service.

Exceptions

throws `ServiceNotFoundException`, `ServiceCreationException`

Example

```
Service service = server.getService("ValidateAddress");
```

Service

The `Service` class is used to process the message (i.e., send the message to the server and receive a response from the server).

Process

Processes the input message and returns the response message.

Syntax

```
public Message process (Message message)
```

Parameters

- Input message

Results

Returns the response message.

Exceptions

- `TimeoutException`: When invalid configuration causes the inability to connect to the server. For example, an unknown protocol would cause a `ConfigurationException`. There is no value in attempting to retry `connect()` when this error occurs.
- `ConnectionException`: When unable to connect to the server. It might be possible to reconnect, depending on the underlying cause of the exception.
- `MessageProcessingException`: When an error occurs on the server that is not due to `ConfigurationException` or `Connection` issues.

Example

```
try
{
    //Process Input Message, return output Message
    Message response = service.process(message);
}
catch (ConnectionException e)
{
    // handle connection issue (retry, report error, etc.)
}
catch (TimeoutException e)
{
    // handle timeout issue (retry, report error, etc.)
}
catch (MessageProcessingException e)
{
    // report error
}
```

Message

The `Message` class sends your input data and receives your output data from the service. The properties for `Message` include context properties, such as account ID, account password, service name, and service method; and option properties, which are the service-specific runtime options.

GetContext

Gets the value by the name in the "context" properties. Context properties include the following constants: account ID, account password, service name, service key, and request ID.

Syntax

```
public String getContext(String name)
```

Parameters

- Name - the name whose associated value is to be returned

Results

Returns the value associated with the name in the context properties. If the name does not exist, the method returns NULL.

Example

```
String value = message.getContext(Message.CONTEXT_ACCOUNT_ID);
```

GetContext

Gets the map that contains all of the context entries.

Syntax

```
public Map getContext()
```

Parameters

- None

Results

Returns the map that contains all of the context entries.

Example

```
Map context = message.getContext();
```

PutContext

Sets the value for the given name in the context properties. If there is an existing value present for the entity identified by the name, it is replaced. Context properties include the following constants: account ID, account password, service name, service key, and request ID.

Syntax

```
public void putContext(String name, String value)
```

Parameters

- Name - the name with which the specified value is to be associated
- Value - the value to be associated with the specified name

Results

None.

Example

```
message.putContext(Message.CONTEXT_ACCOUNT_ID, "user1");
```

PutContext

Adds the new context properties to the current context properties.

Syntax

```
public void putContext(Map map)
```

Parameters

- The new context hashtable to be added to the current context hashtable

Results

None.

Example

```
Map context = new HashMap();  
...  
message.putContext(context);
```

SetContext

Overwrites the current context properties with the new context properties.

Syntax

```
public void setContext(Map map)
```

Parameters

- The new context map that will replace the current context map.

Results

None.

Example

```
Map context = new Map ();  
...  
message.setContext(context);
```

GetOption

Gets the value by the name in the option properties. Option properties are the service-specific run-time options.

Syntax

```
public String getOption(String name)
```

Parameters

- Name - the name whose associated value is to be returned.

Results

Returns the value for the name in the option properties in the message OR NULL if the name does not exist.

Example

```
String value = message.getOption("OutputCasing");
```

GetOptions

Gets the map that contains all of the option entries.

Syntax

```
public Map getOptions();
```

Parameters

- None

Results

Returns the map that contains all of the option entries.

Example

```
Map options = message.getOptions();
```

PutOption

Sets the value for the given name in the option properties. If there is an existing value present for the entity identified by the name, it is replaced. Option properties are the service specific run-time options.

Syntax

```
public void setOption(String name, String value)
```

Parameters

- Name—name with which the specified value is to be associated
- Value—value to be associated with the specified name

Results

None.

Example

```
message.setOption("OutputCasing", "M");
```

PutOptions

Adds the new option properties to the current option properties.

Syntax

```
public void putOptions(Map map)
```

Parameters

- The new option map to be added to the current option properties

Example

```
Map options = new HashMap();  
...  
message.putOptions(options);
```

SetOptions

Overwrites the current option properties with the new option properties.

Syntax

```
public void setOptions(Map map)
```

Parameters

- The new option map to replace the current option map

Results

None.

Example

```
Map options = new HashMap();  
...  
message.setOptions(options);
```

GetError

Gets the error message from the message.

Syntax

```
public String getError()
```

Parameters

- None

Results

Returns the error message in the message.

Example

```
String error = message.getError();
```

GetDataTable

Gets the data table in this message.

Syntax

```
public DataTable getDataTable()
```

Parameters

None.

Results

None.

Example

```
DataTable dataTable = message.getDataTable();
```

DataTable

`DataTable` contains the records for your input and output data. Using the methods associated with this class, you define the column names for your output and add records to the `DataTable`.

AddColumn

Adds the new column to the `DataTable`.

Syntax

```
public int addColumn(String columnName)
```

Parameters

- columnName

Results

Returns the index of the column

Example

```
DataTable dataTable = message.getDataTable();  
int columnIndex = dataTable.addColumn("AddressLine1");  
columnIndex = dataTable.addColumn("City")
```

GetColumnNames

Gets all the column names.

Syntax

```
public String[] getColumnNames()
```

Parameters

- None

Results

Returns the string array of column names.

Example

```
String[] columnNames = dataTable.getColumnNames();
```

GetColumnIndex

Gets the corresponding column index.

Syntax

```
public int getColumnIndex(String columnName)
```

Parameters

- Column name

Results

Returns the corresponding column index.

Example

```
int columnIndex = dataTable.getColumnIndex("City");
```

GetColumnCount

Gets the number of columns in the DataTable.

Syntax

```
public int getColumnCount()
```

Parameters

- None

Results

Returns the number of columns.

Example

```
int columnCount = dataTable.getColumnCount();
```

Clear

Clears the data in the DataTable.

Syntax

```
public void clear()
```

Parameters

- None

Results

None.

Example

```
dataTable.clear();
```

Iterator

An iterator that contains all DataRowS in the DataTable.

Syntax

```
public Iterator iterator()
```

Parameters

- None

Results

Returns an iterator that contains all DataRowS in the DataTable.

Example

```
Iterator iter = dataTable.iterator();  
while (iter.hasNext())  
{  
    DataRow row = (DataRow)iter.next();  
}
```

AddRow

Adds a row to the DataTable.

Syntax

```
public void addRow(DataRow row)
```

Parameters

- Row - DataRow to be added to the DataTable

Results

None.

Example

```
DataTable dataTable = message.getDataTable();  
  
DataRow row = dataTable.newRow();  
row.set("AddressLine1", "4203 Greenridge");  
  
dataTable.addRow(row);
```

NewRow

Creates a new DataRow to the DataTable.

Syntax

```
public DataRow newRow()
```

Parameters

- None

Results

Returns the newly created DataRow

Example

```
DataRow row = dataTable.newRow();  
row.set("AddressLine1", "4203 Greenridge");  
  
dataTable.addRow(row);
```

GetRowCount

Gets the number of DataRows in the DataTable.

Syntax

```
public int getRowCount()
```

Parameters

- None

Results

Returns the number of DataRows in the DataTable.

Example

```
int rowCount = dataTable.getRowCount();
```

Merge

Merges the given DataTable and the current DataTable.

Syntax

```
public void merge(DataTable other)
```

Parameters

- The other DataTable to be merged with the current DataTable

Results

None.

Example

```
DataTable otherDataTable = new DataTable();  
dataTable.merge(otherDataTable);
```

DataRow

`DataRow` contains the individual records for your input and output data. Using the methods associated with this class, you define the column names for your output and add records to the `DataTable`.

GetColumnNames

Gets all the column names.

Syntax

```
public String[] getColumnNames()
```

Parameters

- None

Results

Returns the string array of column names.

Example

```
String[] columnNames = dataRow.getColumnNames();
```

GetColumnIndex

Gets the corresponding column index.

Syntax

```
public int getColumnIndex(String columnName)
```

Parameters

- Name - column name

Results

Returns the corresponding column index.

Example

```
int columnIndex = dataRow.getColumnIndex("City");
```

Get

Gets the value from the field array by the column index in this DataRow.

Syntax

```
public String get(int index)
```

Parameters

- Index with which the specified value is to be associated

Results

Returns the value for the column index in this DataRow.

Example

```
String value = dataRow.get(1);
```

Get

Gets the value from the field array by the column name in this DataRow.

Syntax

```
public String get(String columnName)
```

Parameters

- Name—name with which the specified value is to be associated

Results

Returns the value for the column name in this DataRow; returns empty string if the column name does not exist.

Example

```
String value = dataRow.get("City");
```

Merge

Merges the given DataRow and the current DataRow.

Syntax

```
public void merge(DataRow other)
```

Parameters

- The other DataRow to be merged with the current DataRow

Results

None.

Example

```
DataRow otherDataRow = new DataRow();  
dataRow.merge(otherDataRow);
```

Set

Sets the value for the corresponding column for the DataRow. If the value for the name exists, the old value is replaced.

Syntax

```
public void set(int Index, String value)
```

Parameters

- The column index with which the specified value is to be associated
- Value to be associated with the specified name

Results

None.

Exceptions

- `IndexOutOfBoundsException` — the column index is invalid

Example

```
DataRow row = dataTable.newRow();
row.set(0, "4203 Greenridge");
row.set(1, "Austin");
row.set(2, "Texas");
dataTable.addRow(row);
```

AddChild

Adds a new DataRow to the named parent/child relationship. If the named relationship exists, the supplied DataRow will be appended to the existing DataRow collection. Otherwise, a new collection will be created with the supplied DataRow as its only element.

Syntax

```
public void addChild(String childName, DataRow childDataRow)
```

Parameters

- Name - the name of the parent/child relationship (e.g., "Flood Plain Data," "References," "Used By," etc.)
- Value - the DataRow to be added to the relationship.

Results

None.

Example

```
DataRow childDataRow = new DataRow();
childDataRow.set("Address", "100 Congress");
...
DataRow dataRow = new DataRow();
...
dataRow.addChild("child1", childDataRow);
```

GetChildren

Retrieves the child rows from a named relationship.

Syntax

```
public List getChildren(String childName)
```

Parameters

- The name of the parent/child relationship, e.g. "Flood Plain Data", "References", "Used By", etc.

Results

Returns the child rows from the named relationship.

Example

```
List childRows = row.getChildren("child1");
```

ListChildNames

Retrieves all of the names of the named parent/child relationships.

Syntax

```
public Set listChildNames()
```

Parameters

None.

Results

Returns the set of the names of the named parent/child relationships.

Example

```
Set childNames = row.listChildNames();
```

SetChildren

Sets the rows of a supplied, named parent/child relationship. If rows previously existed under this name, they will be returned to the caller.

Syntax

```
public List setChildren(String childName, List DataRows)
```

Parameters

None.

Results

Returns the set of the names of the named parent/child relationships.

Example

```
List rows = dataRow.getChildren("child1");  
parentRow.setChildren("child2", rows);
```

Set

Sets the value for the corresponding column for the DataRow. If the value for the name exists, the old value is replaced.

Syntax

```
public void set(int Index, String value)
```

Parameters

- The column index with which the specified value is to be associated
- Value to be associated with the specified name

Results

None.

Exceptions

- `IndexOutOfBoundsException` — the column index is invalid

Example

```
DataRow row = dataTable.newRow();  
row.set(0, "4203 Greenridge");  
row.set(1, "Austin");  
row.set(2, "Texas");  
dataTable.addRow(row);
```

5 - The .NET API

In this section

Introduction	150
Server	154
Service	156
Message	157
EnhancedDataTable	164

Introduction

.NET is a Microsoft® operating system platform that incorporates applications and a suite of tools and services which enhance Web service and application development.

The .NET framework uses components called Common Language Runtime (CLR), Framework Class Library (FCL), and ASP.NET. The CLR is equivalent to the Java Virtual Machine, in that it manages code and executes it in the native language of the machine on which it runs. The Framework Class Library is a massive library of re-usable object types that cover a myriad of program functions. ASP.NET is a server-side technology that allows web pages and services to load much faster than traditional ASP pages. Together, these three components of the .NET framework make application and Web development easier, more streamlined, and provides easier integration into existing environments. Clients and servers on different platforms running services written in various programming languages can communicate with each other swiftly and easily.

For more information on .NET technology, go to msdn.microsoft.com/netframework.

Constants

The .NET API uses two sets of constants. The first set is for the `Server` component, described in the table below.

Table 22: Constants for the `Server` Component

Constant Name	Description	Example
<code>Server.HOST</code>	String for server host name. Default is "localhost".	65.89.200.89
<code>Server.PORT</code>	String for server port. Default is "8080".	10119
<code>Server.ACCOUNT_ID</code>	String for server account ID. Default is null.	user1
<code>Server.ACCOUNT_PASSWORD</code>	String for server account password. Default is null.	user1

Constant Name	Description	Example
Server.CONNECTION_TIMEOUT	String for server connection timeout, in millisecond. Default is "10000".	50000
Server.CONNECTION_TYPE	String for server connection type. Currently only supports HTTP, HTTPS, or SOCKET. Defaults is "HTTP".	HTTP(S)
Server.PROXY_HOST	String for proxy server host name. Default is null.	192.168.1.77
Server.PROXY_PORT	String for proxy server port. Default is null.	8080
Server.PROXY_USER	String for proxy server account ID. Default is null.	user1
Server.PROXY_PASSWORD	String for proxy server account password. Default is null.	user1

The second set of constants is for the `Message` component.

Table 23: Constants for the `Message` Component

Constant Name	Description	Example
Message.CONTEXT_ACCOUNT_ID	String for message context account ID.	user1
Message.CONTEXT_ACCOUNT_PASSWORD	String for message context account password.	user1
Message.CONTEXT_SERVICE_NAME	String for message context service name.	echoservice

Error Messages

The .NET API uses the following error messages:

- Error Messages for Connection
 - "Connection type not supported."
 - "Client timeout"
- Error Messages for Message Packaging Exception
 - "Input Message is null."

The other error messages will come from the .NET Framework Class Library if they do not get used properly.

Example Application

The sample code shown below illustrates how to use the .NET API.

```
using System;
using System.IO;
using System.Collections;
using System.Text;
using System.Data;
using glclient;

try
{
    //Create Server
    Server server = new Server();

    //Set connect property to the server
    server.SetConnectionProperty(Server.HOST, "localhost");
    server.SetConnectionProperty(Server.PORT, "10119");
    server.SetConnectionProperty(Server.CONNECTION_TYPE, "SOCKET");
    server.SetConnectionProperty(Server.ACCOUNT_ID, "guest");
    server.SetConnectionProperty(Server.ACCOUNT_PASSWORD, "");

    //Connect to server
    server.Connect();

    //Get Service From Server
    Service service = server.GetService("ValidateAddress");

    //Create Input Message
    Message request = new Message();
```

```

//Fill dataTable in the input message
//Datatable is the .net Framework class
DataTable dataTable = request.GetDataTable();

DataColumn column1 = new DataColumn();
column1.DataType = System.Type.GetType("System.String");
column1.ColumnName = "AddressLine1";
dataTable.Columns.Add(column1);

DataColumn column2 = new DataColumn();
column2.DataType = System.Type.GetType("System.String");
column2.ColumnName = "City";
dataTable.Columns.Add(column2);

DataColumn column3 = new DataColumn();
column3.DataType = System.Type.GetType("System.String");
column3.ColumnName = "StateProvince";
dataTable.Columns.Add(column3);

DataRow newRow = dataTable.NewRow();
newRow[0]="4200 Parliament Place";
newRow[1]="Lanham";
newRow[2]="Maryland";

dataTable.Rows.Add(newRow);

//Set "option" Properties to the Input Message
request.PutOption("OutputCasing", "M");
request.PutOption("OutputRecordType", "A");

//Process Input Message, return output Message
Message reply = service.Process(request);

//Disconnect from server
server.Disconnect();

//Get the result from the response message
DataTable returnDataTable = reply.GetDataTable();

foreach(DataColumn dc in returnDataTable.Columns)
{
// more code to be added
string columnName = dc.ColumnName;
}
foreach(DataRow dr in returnDataTable.Rows)
{
for (int col = 0; col < returnDataTable.Columns.Count; col++)
{
// more code to be added
string value = (String)dr[col] ;
Console.WriteLine(value);
}
}

```

```
}  
}  
catch (Exception e)  
{  
  
    //Error handling  
    Console.WriteLine("Error Ocurred, " + e.ToString());  
}
```

Server

The `Server` class is used to connect to the server, disconnect from the server, and get the service from the server.

Connect

Reads the properties to determine which gateway connection to be used and makes a connection to the server.

Note: .NET uses the HTTP, HTTPS, or SOCKET server connection protocol. HTTP and HTTPS logically establish a client connection but do not actually connect to the server until a `GetService` or `Process` method is invoked. The SOCKET protocol establishes a connection to the server when `Connect` is invoked.

Syntax

```
public void Connect()
```

Parameters

None.

Results

None.

Exceptions

- "Connection type not supported."

Example

```
Server server = new Server();

// set connect property to the server
server.SetConnectionProperty(Server.HOST, "localhost");
server.SetConnectionProperty(Server.PORT, "8080");
// more connection properties to be set
// Connect to server
server.Connect();
```

Disconnect

Disconnects from the server.

Syntax

```
public void Disconnect()
```

Parameters

None.

Results

Client is disconnected from the server.

Example

```
//Disconnect from server
server.Disconnect();
```

SetConnectionProperty

Establishes the server connection configuration properties, such as host name and length of timeout.

Syntax

```
public void SetConnectionProperty(String name, String value)
```

Parameters

- Name — the name of the connection property, such as HOST
- Value — the value for the name of the connection property, such as "www.myhost.com"

Results

None.

Example

```
Server server = new Server();  
  
server.SetConnectionProperty(Server.HOST, "localhost");  
server.SetConnectionProperty(Server.PORT, "8080");  
  
//Connect to server  
server.Connect();
```

GetService

Gets the service from the server.

Note: See the Component Reference section of this guide for a list of services that may be available to you.

Syntax

```
public Service getService(String serviceName)
```

Parameters

- Name—name of service

Results

Returns the specific service.

Example

```
Service service = server.GetService("ValidateAddress");
```

Service

The `Service` class is used to process the message (in other words, it sends the message to the server and receives a response from the server).

Process

Processes the input message and returns the response message.

Syntax

```
public Message Process(Message, message)
```

Parameters

- Input message

Results

Returns the response message.

Exceptions

MessageProcessingException

Example

```
//Process Input Message, return output Message  
Message reply = service.Process(request);
```

Message

The `Message` class sends your input data and receives your output data from the service. The properties for `Message` include context properties, such as account ID, account password, service name, and service method; and option properties, which are the Service-specific runtime options.

GetContext

Gets the value by the name in the context properties. Context properties include the following constants: account ID, account password, service name, service key, and request ID.

Syntax

```
public String GetContext(String name)
```

Parameters

None.

Results

Returns the value associated with the name in the "context" properties. If the name does not exist, the method returns NULL.

Example

```
String value = message.GetContext(Message.CONTEXT_ACCOUNT_ID);
```

GetContext

Gets the hashtable that contains all of the context entries. Hashtable is the .NET Framework class.

Syntax

```
public Hashtable GetContext()
```

Parameters

- None

Results

Returns the hashtable that contains all of the context entries.

Example

```
Hashtable context = message.GetContext();
```

PutContext

Sets the value for the given name in the context properties. If there is an existing value present for the entity identified by the name, it is replaced. Context properties include the following constants: account ID, account password, service name, service key, and request ID.

Syntax

```
public void PutContext(String name, String value)
```

Parameters

- Name—name with which the specified value is to be associated
- Value—value to be associated with the specified name

Example

```
message.PutContext(Message.CONTEXT_ACCOUNT_ID, "user1");
```

PutContext

Adds the new context properties to the current context properties.

Syntax

```
public void PutContext(Hashtable context)
```

Parameters

- The new context hashtable to be added to the current context hashtable

Results

None.

Example

```
//Hashtable is the .NET Framework class  
Hashtable context = new Hashtable();  
//more code  
message.PutContext(context);
```

SetContexts

Overwrites the current context properties with the new context properties.

Syntax

```
public void SetContexts(Hashtable context)
```

Parameters

- Context - the new context hashtable that will replace the current context hashtable.

Results

None.

Example

```
//Hashtable is the .NET Framework class
Hashtable context = new Hashtable();
//more code
message.SetContexts(context);
```

GetOption

Gets the value by the name in the option properties. Option properties are the service-specific run-time options.

Syntax

```
public String GetOption(String name)
```

Parameters

- Name - the name whose associated value is to be returned.

Results

Returns the value for the name in the "option" properties in the message or NULL if the name does not exist.

Example

```
String value = message.GetOption("OutputCasing");
```

GetOptions

Gets the hashtable that contains all of the option entries. Hashtable is the .NET Framework class.

Syntax

```
public Hashtable GetOptions();
```

Parameters

- None

Results

Returns the hashtable that contains all of the option entries.

Example

```
Hashtable options = message.GetOptions();
```

PutOption

Sets the value for the given name in the option properties. If there is an existing value present for the entity identified by the name, it is replaced. Option properties are the Service specific run-time options.

Syntax

```
public void PutOption(String name, String value)
```

Parameters

- Name—name with which the specified value is to be associated
- Value—value to be associated with the specified name

Example

```
message.PutOption("OutputCasing", "M");
```

PutOptions

Adds the new option properties to the current option properties.

Syntax

```
public void PutOptions(Hashtable options)
```

Parameters

- Option - the new option hashtable to be added to the current option hashtable

Results

None.

Example

```
//Hashtable is the .NET Framework class
Hashtable options = new Hashtable();
// more code
message.PutOptions(options);
```

SetOptions

Overwrites the current option properties with the new option properties.

Syntax

```
public void SetOptions(Hashtable options)
```

Parameters

- Options - the new option hashtable to replace the current option hashtable

Results

None.

Example

```
//Hashtable is the .NET Framework class
Hashtable options = new Hashtable();
//more code
message.SetOptions(options);
```

GetError

Gets the error message from the message.

Syntax

```
public String GetError()
```

Parameters

- None

Results

Returns the error message in the message.

Example

```
String error = message.GetError();
```

GetDataTable

Gets the DataTable in this message. DataTable is .NET Framework class.

Syntax

```
public DataTable GetDataTable()
```

Parameters

None.

Results

None.

Example

```
//DataTable is the .net Framework class
DataTable dataTable = message.GetDataTable();

DataColumn column1 = new DataColumn();
column1.DataType = System.Type.GetType("System.String");
column1.ColumnName = "AddressLine1";
dataTable.Columns.Add(column1);

DataColumn column2 = new DataColumn();
column2.DataType = System.Type.GetType("System.String");
column2.ColumnName = "City";
dataTable.Columns.Add(column2);

DataRow newRow = dataTable.NewRow();
newRow[0]="4203 Greenridge";
newRow[1]="Austin";

dataTable.Rows.Add(newRow);
```

EnhancedDataTable

EnhancedDataTable is a class which extends .NET class DataTable.

AddChild

Adds a new DataRow to the named parent/child relationship. If the named relationship exists, the supplied DataRow will be appended to the existing DataRow collection. Otherwise, a new collection will be created with the supplied DataRow as its only element.

Syntax

```
public void AddChild(DataRow parentRow, string name, DataRow newChild)
```

Parameters

- Name - the name of the parent/child relationship (e.g., "Flood Plain Data," "References," "Used By," etc.)
- DataRow - the DataRow to be added to the relationship.

Results

None.

Example

```
EnhancedDataTable dataTable = new EnhancedDataTable();

dataTable.Columns.Add(new DataColumn("AddressLine1",
System.Type.GetType("System.String")));
dataTable.Columns.Add(new DataColumn("City",
System.Type.GetType("System.String")));
dataTable.Columns.Add(new DataColumn("StateProvince",
System.Type.GetType("System.String")));
dataTable.Columns.Add(new DataColumn("PostalCode",
System.Type.GetType("System.String")));

DataRow row = dataTable.NewRow();

row[0] = "510 S Coit St";
row[1] = "Florence";
row[2] = "SC";
```

```

row[3] = "29501-5221";

EnhancedDataTable childDataTable = new EnhancedDataTable();

childDataTable.Columns.Add(new DataColumn("AddressLine2",
System.Type.GetType("System.String")));
childDataTable.Columns.Add(new DataColumn("City",
System.Type.GetType("System.String")));
childDataTable.Columns.Add(new DataColumn("StateProvince",
System.Type.GetType("System.String")));
childDataTable.Columns.Add(new DataColumn("PostalCode",
System.Type.GetType("System.String")));

DataRow childRow = childDataTable.NewRow();

childRow[0] = "241 Ne C St";
childRow[1] = "Willamina";
childRow[2] = "OR";
childRow[3] = "97396-2714";

dataTable.AddChild(row, "Child1", childRow);
dataTable.Rows.Add(row);

```

GetChildren

Retrieves the child rows from a named relationship.

Syntax

```
public EnhancedDataTable GetChildren(DataRow parentRow, string name)
```

Parameters

- ParentRow - the parent row
- Name - the name of the parent/child relationship, e.g. "Flood Plain Data", "References", "Used By", etc.

Results

Returns the child rows from the named relationship.

Example

```
EnhancedDataTable childRows = dataTable.GetChildren(parentRow, "child1");
```

ListChildNames

Retrieves all of the names of the named parent/child relationships.

Syntax

```
public string[] ListChildrenNames(DataRow parentRow)
```

Parameters

None.

Results

Returns the set of the names of the named parent/child relationships.

Example

```
string[] childNames = dataTable.ListChildrenNames( parentRow);
```

SetChildren

Sets the rows of a supplied, named parent/child relationship. If rows previously existed under this name, they will be returned to the caller.

Syntax

```
public void SetChildren(DataRow parentRow, string name, EnhancedDataTable  
newTable)
```

Results

Returns the set of the names of the named parent/child relationships.

Example

```
EnhancedDataTable childRows = dataTable1.GetChildren(parentRow,  
"child1");  
dataTable2.SetChildren(otherParentRow, "child1", childRows);
```

6 - ManagementAPI Methods (Deprecated)

In this section

Introduction	168
GetLicenseInfo	168
GetVersionInfo	169

Introduction

Important: The ManagementAPI web service is deprecated and will be removed in a future release. Use the Administration Utility to get license and version information about your system. For more information about the Administration Utility, see the *Administration Guide*.

There are two management API methods that are publicly available via the ManagementAPI web service: `getLicenseInfo` and `getVersionInfo`. The WSDL URL for the ManagementAPI Web service is:

```
http://SpectrumServer:8080/managers/ManagementAPIService?wsdl
```

Where *SpectrumServer* is the host name or IP address of your Spectrum™ Technology Platform server.

GetLicenseInfo

Important: The ManagementAPI web service is deprecated and will be removed in a future release. Use the Administration Utility to get license and version information about your system. For more information about the Administration Utility, see the *Administration Guide*.

The method `GetLicenseInfo` returns a license object. The license object contains properties for machine type, operating system type, hostname, and CPU limit. It also contains an array of feature objects and an array of restriction objects. These arrays can be processed to determine specific information about features and restrictions. Feature has an ID, a name, and an enabled flag. Restriction has an ID, a limit, and a start date.

Web Service

ManagementAPIService

Parameters

None.

Result

Returns the license object.

Example

```

License
  string machineType
  string osType
  string hostName
  string CPULimit
  Feature[] features
  Restriction[] restrictions

Feature
  string ID;
  string name;
  Restriction[] restrictions

Restriction
  string ID
  long limit
  datetime startDate
  Feature[] features

ExpirationRestriction extends Restriction

UsageRestriction extends Restriction
  long usages

```

GetVersionInfo

Important: The ManagementAPI web service is deprecated and will be removed in a future release. Use the Administration Utility to get license and version information about your system. For more information about the Administration Utility, see the *Administration Guide*.

The GetVersionInfo method returns an array of VersionInfo objects. A VersionInfo object has a name, version number, and a list of VersionAttribute objects. VersionAttribute objects are simple classes that have a label and a value. GetVersionInfo attributes are product-specific as the information is gathered and returned by the product itself. This same information is also displayed in the Version Information node of the Management Console.

Note: You must run GetVersionInfo once, see what values come back, and then parse the information to get specific pieces of information.

Web Service

ManagementAPIService

Parameters

None.

Result

Returns VersionInfo objects.

Example

```
VersionInfo
  string name
  string version
  VersionAttribute[] attributes

VersionAttribute
  string label
  string value
```

7 - Module Services

In this section

Enterprise Geocoding Module	172
Enterprise Tax Module	369
GeoConfidence Module	513
Global Addressing Module	516
Universal Addressing Module	578
Universal Name Module	760

Enterprise Geocoding Module

Enterprise Geocoding Module

The Enterprise Geocoding Module performs address standardization, address geocoding, and postal code centroid geocoding. You can enter an address and get outputs such as geographic coordinates, which can be used for detailed spatial analysis and demographics assignment. You can also enter a geocode, a point represented by a latitude and longitude coordinate, and receive address information about the provided geocode.

Components

Enterprise Geocoding Module consists of the following stages. The specific stages you have depend on your license.

- **Geocode Global**—Takes an address in any supported country and returns latitude/longitude coordinates and other information. Geocode Address Global geocodes addresses only from countries you have licensed.
- **Geocode Address World**—Takes an address located in any of the supported countries and returns the city centroid or, for some countries, postal centroid. Geocode World cannot geocode to the street address level.
- **Geocode US Address**—Takes an input address and returns latitude/longitude coordinates and other address information.
- **GNAF PID Location Search**—Identifies the address and latitude/longitude coordinates for a Geocoded National Address File Persistent Identifier (G-NAF PID).
- **Reverse APN Lookup**—Takes an Assessor's Parcel Number (APN), Federal Information Processing Standards (FIPS) county code, and FIPS state code and returns the address of the parcel.
- **Reverse Geocode US Location**—Takes as input a geocode (latitude and longitude coordinate) and returns the address of the location.
- **Reverse Geocode Global** – for all countries except USA.
- **Reverse pbKey Lookup**—Takes a pbKey™ unique identifier as input and returns all standard returns that are provided as part of address matching.

Deprecated Components

The following stages have been deprecated:

- **Geocode Address AUS**— *Use the Global Geocoding Module's Global Geocoding stage.* Takes an address in Australia and returns latitude/longitude coordinates and other information. It also can geocode against a Geocoded National Address File Persistent Identifier point (G-NAF PID).

- **Geocode Address GBR—Use the Global Geocoding Module's Global Geocoding stage..**
Takes an address in Great Britain and returns latitude/longitude coordinates and other information.

Enterprise Geocoding Databases

The following Enterprise Geocoding Module databases are installed on the Spectrum™ Technology Platform server. Some of the databases are available by subscription from Pitney Bowes and are updated monthly or quarterly. Others are licensed from the USPS®.

U.S. Geocoding Databases (U.S. Only)

These databases contain the spatial data necessary to perform address standardization and geocoding. You must install at least one of these databases to perform geocoding for USA. You set the database that you want to match against with the processing options. Enterprise Geocoding tries to match to the database you indicate. To verify you are matching to the database you want, you can review the value returned in the StreetDataType output field.

These databases use proprietary files called GSD files. For ZIP Code centroid matching, the file us.Z9 contains all the centroid info for all states and normally has a z9 extension.

- **Centrus Enhanced Geocoding**—This database consists of TIGER data provided by the U.S. Geological Survey and address data provided by the U.S. Postal Service.
- **TomTom Geocoding**—This database provides more up-to-date data than the Centrus Enhanced Geocoding database. It requires an additional license. This data is provided by TomTom, a third-party provider of spatial data, and postal data from the U.S. Postal Service.
- **HERE Geocoding**—This database provides more up-to-date data than the Centrus Enhanced Geocoding database. It requires an additional license. HERE data is provided by HERE, a third-party provider of spatial data. For more information about these databases, contact your sales representative.
- **ZIP + 4 Centroid**—This database provides only address standardization and ZIP + 4 centroid matching. It does not provide street-level matching.

Each geocoding database has an optional Statewide Intersections Index. The Statewide Intersection Index is designed to enable fast intersection identification on a statewide basis. For example, the Statewide Intersection Index will allow the database search for "1st and Main St, CO" and return a list of possible matches in Colorado more quickly than searching the entire geocoding database for each instance of the intersection.

U.S. Points Databases (U.S. Only)

Points databases contain data for locating the center of a parcel. These databases provides enhanced geocoding accuracy for internet mapping, property and casualty insurance, telecommunications, utilities, and others.

These databases are optional, but either Centrus Enhanced Points or Centrus Premium Points is required for Reverse Assessor's Parcel Number (APN) Lookup. These databases are also separately licensed.

- **Centrus Points**—This database contains the data necessary to locate the center of a parcel or building. It does not contain Assessor's Parcel Number (APN) or elevation data.
- **Centrus Elevation**—This database contains the same data as Centrus Points, plus elevation data.
- **Centrus Enhanced Points**—This database contains the same data as Centrus Points, plus APN data.
- **Centrus Premium Points**—This database contains the same data as Centrus Points, plus both APN and elevation data.
- **HERE Points Database**—The data in this database is provided by HERE, a third-party provider of spatial data.
- **TomTom Points Database**—The data in this database is provided by TomTom, a third-party provider of spatial data.
- **Master Location Data** — This database provides the best available address point location for every mailable and deliverable address in the United States.

Reverse Geocoding Database (U.S. Only)

This database contains the data you need to convert a latitude/longitude location to an address.

This database is optional, but is required for ReverseGeocodeUS. This database is also separately licensed.

Auxiliary Files (U.S. Only)

Auxiliary files contain user-defined records. You can use auxiliary files to provide custom data to use in address matching and geocode matching.

DPV® Database (U.S. Only)

The Delivery Point Validation database allows you to check the validity of any individual mailing address in the U.S. The DPV database is distributed as an optional feature and can be installed to enhance the geocoding database's ability to validate mailing addresses. Each time an edition of the geocoding database is released, a corresponding edition of the optional DPV database is released. The date of the DPV database must match the date of the geocoding database for DPV processing to function. DPV lookups may not be performed after the expiration date of the DPV database.

This database is optional, but is required for CASS™ processing. The DPV database is also required to determine ZIP + 4 and ZIP + 4 related output (DPBC, USPS record type, etc.). This database is also separately licensed.

Note:

Postal Service licensing prohibits using DPV for the generation of addresses or address lists, and also prohibits the DPV database being exported outside the United States.

EWS Database (U.S. Only)

The Early Warning System (EWS) database contains data that prevents address records from miscoding due to a delay in postal data reaching the U.S. Postal database.

The USPS® refreshes the EWS file on a weekly basis. Unlike the DPV and LACS^{Link} databases, the EWS database does not need to have the same date as the geocoding database. You can download the EWS.zip file free of charge from the CASS section of the USPS® RIBBS website at:

<https://postalpro.usps.com/cass/EWS>

When you download the EWS database, you will receive a file named OUT. You must rename the OUT file to EWS.txt before using it.

LACS^{Link} Database (U.S. Only)

The LACS^{Link} database allows you to correct addresses that have changed as a result of a rural route address converting to street-style address, a PO Box renumbering, or a street-style address changing.

This database is optional, but is required for CASS™ processing. The LACS^{Link} database is also required in CASS mode to receive ZIP + 4 and ZIP + 4 related output (delivery point bar code, USPS record type, etc.).

The date of the LACS^{Link} database must match the date of the geocoding database for LACS^{Link} processing to function.

Note:

USPS licensing prohibits using LACS^{Link} for the generation of addresses or address lists, and also prohibits the LACS^{Link} database being exported outside the United States.

International Geocoding Databases

International geocoding databases contain the spatial data necessary to perform address standardization and geocoding for locations outside the U.S. Each country has its own database, and some countries have optional databases that provide enhanced geocoding.

United Kingdom AddressBase Premium Database

AddressBase Premium is a point database sourced from Ordnance Survey®, Royal Mail, and local authorities.

The AddressBase Premium database provides the highest level of precision, as reflected in S8 result codes. The database includes objects without postal addresses, such as subdivided properties, places of worship and community centers.

The AddressBase Premium database is built around the UPRN (Unique Property Reference Number). The UPRN is the unique identifier that provides a persistent reference to a unique property, regardless of changes in the property name, status, subdivision, use (such as from single occupancy to multiple occupancy) or demolition of the property. All historic, alternative, and provisional addresses are recorded against the same UPRN. The UPRN is returned with every AddressBase Premium candidate, except for Northern Ireland addresses.

Since the Ordnance Survey data source does not contain addresses for Northern Ireland, AddressBase Premium is supplemented with Royal Mail® postcode address data for Northern Ireland. This Northern Ireland data has postcode centroid (result code S3) precision only.

For more information on the AddressBase Premium, see <https://www.ordnancesurvey.co.uk/business-and-government/help-and-support/products/addressbase-premium.html> from Ordnance Survey.

United Kingdom CodePoint Database

The CodePoint Postal Address File (PAF) database provides postcode centroid geocoding. The CodePoint database is suitable for most applications involving address matching, validation, etc.

The CodePoint database is sourced from Royal Mail and covers street addresses for the UK (Great Britain and Northern Ireland). The CodePoint database is licensed for the entire dataset, rather than by region. The postcode centroid precision provided by the CodePoint database is reflected in S3 result codes.

For more information on the Royal Mail data source, see:

<http://www.royalmail.com>

Australia Geocoded National Address File (G-NAF)

This database provides enhanced geocoding for Australian addresses. This is the only authoritative Australian national index of locality, street and number, validated with geographic coordinates. It contains both officially recognized rural and urban addresses and unofficial addresses (aliases). Postal addresses and PO Boxes are not included. However, because some rural areas do not have adequate rural address information, roadside mail box (RMB) numbers, Lot numbers, and Block & Section numbers have been included in the G-NAF data set.

When you install this database there will be two subfolders:

- **GNAF123**—Contains the point-level dictionary. This has the highest precision of geocoding (characterized by Reliability Level 1, 2, or 3.)
- **GNAF456** —Contains the remainder of address information in G-NAF that does not meet high precision geocoding criteria (characterized by Reliability Level 4, 5, or 6.)

You must specify each of these as separate database resources in the Management Console.

We recommend that you use both databases to validate the existence of addresses but only use the GNAF123 for parcel-level geocoding. If you do not require parcel-level geocodes you can use the GNAF456 database for geocoding.

New Zealand Point Database

The New Zealand Point Database is based on postal point data which has a roof top precision point of each unique street address. Location X and Y returned for candidates from this database are roof top precision.

This data is maintained by the government authority, Land Information New Zealand.

Other Point Databases for International Countries

A number of other point databases are available for international countries. Refer to the quarterly data release notes for more information.

Geocoding Concepts

Geocoding is the process of determining the latitude/longitude coordinates of an address. There are different ways that an address can be geocoded. In order of most accurate to least accurate, these methods are:

Point Level Matching

Point-level matching locates the center of the actual building footprint or parcel. This is the most accurate type of geocode and is used in industries such as internet mapping, insurance, telecommunications, and utilities.

Centerline matching is used with point-level matching to tie a point-level geocode with its parent street segment. This provides you with additional data about the parent street segment that is not retrievable using only the point-level match. The output information also includes the bearing from the point data geocode to the centerline match.

Street Matching

Street matching identifies the approximate location of an address on a street segment. In street matching, the location is determined by calculating the approximate location of a house number based on the range of numbers in the location's street. For example, if the address is on a street segment with a range of addresses from 50 to 99, then it is assumed that the house number 75 would be in the middle of the street segment. This method assumes that the addresses are evenly spaced along the street segment. As a result, it is not as exact as point matching since addresses may not be evenly distributed along a street segment.

For example, the following diagram shows the results of street-level matching along a segment with unevenly-spaced buildings. The first three buildings are fairly accurately geocoded because they are evenly spaced. The fourth building, however, resides on a slightly larger parcel than the others along this street. Since street-level matching assumes that the buildings are evenly spaced, the result is that fourth, fifth, and sixth houses are not as precise as the first three. If you were to use point-level geocoding, the results would be more accurate.

Centroid Matching

ZIP Code centroid matching is a center point of an area defined by either a ZIP Code or a ZIP + 4, and is the least accurate type of geocode. A ZIP Centroid is the center of a ZIP Code; a ZIP + 4 centroid is the center of a ZIP + 4. Since a ZIP + 4 represents a smaller area than a ZIP Code, a ZIP + 4 centroid is more accurate than a ZIP Code centroid.

The following diagram illustrates centroid matching. All six houses would have the same ZIP Code geocode because they all reside in the same ZIP Code. The four houses located in the dashed area of the diagram would have the same ZIP + 4 centroid returned, whereas the two houses that are outside of the dashed area would not since they don't reside in the ZIP + 4 Code area.

Geocoding Match Strategies for Non-U.S. Locations

The Enterprise Geocoding Module offers a variety of options for controlling geocoding precision and match rate. The following information describes different approaches for matching which you can apply to any country geocoder except the U.S. geocoder (GeocodeUSAddress), which has a different set of options.

Maximizing the Match Rate

To generate the highest match rate possible, do not specify house number, street, and city/locality using the ExactMatch option.

Another way to maximize the match rate is by setting `FallbackToPostal=Y`. This means that the geocoder will fall back to the four-digit postcode centroid if a close street level match cannot be made. While this scenario might yield false positives, it may be the best matching solution when you have large databases to geocode.

You should evaluate if the percentage of false positives will affect your analysis. To reduce the number of false positives without sacrificing hit rate, analyze the result codes after a geocoding session and adjust your settings accordingly.

Maximizing Precision

If your analysis requires highly precise geocoded addresses, choose a strategy in which the geocoder returns the maximum percentage of high precision geocodes and the lowest number of imprecise matches (false positives). To do this, use the ExactMatch option to require close matches to match on all address elements. Also, set FallbackToPostal=N.

This technique may produce a lower percentage match rate, but will provide the best precision.

Balancing Match Rate and Precision

You may want to use a balanced strategy between match rate and geographic precision. That is, you may want to geocode as many records as possible automatically, but at the same time want to minimize the number of weaker matches (false positives). For example, false positives can occur when the geocoder:

- finds a street that sounds like the input street.
- finds the same street in another city (if postal code match is not required).
- finds the street but with a different house number (if house number is not required).

The following settings may achieve a good balance between match rate and precision:

- **CloseMatchesOnly**—Specify "Y".
- **MustMatchHouseNumber**—Specify "Y".
- **MustMatchStreet**—Specify "Y".
- **FallbackToPostal**—Specify "N".

Postal Concepts

The following sections contain information about postal concepts used by the Enterprise Geocoding Module.

Note: This section and the topics of Locatable Address Conversion System, Delivery Point Validation, and Early Warning System are relevant to USA geocoding only.

Dual Addresses

GeocodeUSAddress can process input that contains two addresses for the same record on the same address line. For example, GeocodeUSAddress can process the following input address:

```
3138 HWY 371  
PO BOX 120  
PRESCOTT AR 71857
```

GeocodeUSAddress does not recognize dual addresses where the two addresses are both street addresses. For example, GeocodeUSAddress does NOT recognize 135 Main St 4750 Walnut St Ste 200. GeocodeUSAddress does recognize dual addresses where the two addresses are the same type of address but are not street addresses. For example, GeocodeUSAddress does recognize PO BOX 12 PO BOX 2000.

After GeocodeUSAddress parses the dual address, it searches for a match. GeocodeUSAddress determines which address has preference for a match based on the processing mode. In CASS mode, GeocodeUSAddress ignores the prefer PO Box and prefer street options, and attempts to find a match based on the following order: PO Box, Street, Rural Route, and General Delivery. In Relaxed mode, GeocodeUSAddress recognizes the Address Preference (AddressPreference) input option.

Note: GeocodeUSAddress does not perform dual address processing in Exact and Close mode. GeocodeUSAddress does not perform dual address processing on multi-line addresses.

Locatable Address Conversion System (LACS)

The USPS® Locatable Address Conversion System (LACS) corrects addresses that have changed as a result of a rural route address converting to street-style address, a PO Box renumbering, or a street-style address changing. The following are examples of LACS^{Link} conversions:

- Rural Route Converted to Street-Style Address: Old Address: RR 3 Box 45 New Address: 1292 North Ridgeland Drive
- Street Renamed and Renumbered: Old Address: 23 Main Street New Address: 45 West First Avenue
- PO Box Renumbered: Old Address: PO Box 453 New Address: PO Box 10435

LACS^{Link} is required for CASS processing.

Delivery Point Validation (DPV)

Delivery Point Validation (DPV®) is a United States Postal Service® (USPS®) technology that validates the accuracy of address information down to the individual mailing address. By using DPV® to validate addresses, you can reduce undeliverable-as-addressed (UAA) mail, thereby reducing postage costs and other business costs associated with inaccurate address information.

Note: DPV® is only available for U.S. addresses.

Without DPV®, the address validation process only verifies that an individual address is within a range of valid addresses for the given street. For example, the USPS data indicates that the range of addresses on Maple Lane is 500 to 1000. You attempt to validate an address of 610 Maple Ln. Without DPV®, this address would appear to be valid because it is in the range of 500 to 1000. However, in reality the address 610 Maple Ln does not exist: the house numbers in this section of the street are 608, 609, 613, and 616. With DPV® processing, you would be alerted to the fact that 610 Maple Ln does not exist and you could take action to correct the address.

DPV[®] also provides unique address attributes to help produce more targeted mailing lists. For example, DPV[®] can indicate if a location is vacant and can identify commercial mail receiving agencies (CMRAs) and private mail boxes.

Although DPV[®] can validate the accuracy of an existing address, you cannot use DPV[®] to create address lists. For example, you can validate that 123 Elm Street Apartment 6 exists, but you cannot ask if there is an Apartment 7 at the same street address. To prevent the generation of address lists, the DPV[®] database contains false positive records. False positive records are artificially manufactured addresses that reside in a false positive table. For each negative response that occurs in a DPV[®] query, a query is made to the false positive table. A match to this table will stop DPV[®] processing.

Early Warning System (EWS)

The Early Warning System (EWS) provides up-to-date address information for new and recently changed addresses that have not yet been updated in the monthly USPS database. EWS prevents address records from miscoding due to a delay in postal data reaching the USPS[®] databases.

The older the U.S. Postal Database, the higher potential you have for miscoding addresses. When a valid address is miscoded because the address it matches to in the U.S. Postal Database is inexact, it will result in a broken address.

EWS data consists of partial address information limited to the ZIP Code[™], street name, predirectional, postdirectional, and a suffix. For an address record to be EWS-eligible, it must be an address not present on the most recent monthly production U.S. Postal Database.

The USPS[®] refreshes the EWS file on a weekly basis. You can download the EWS file from the USPS[®] website at <https://postalpro.usps.com/cass/EWS>.

Geocode Address Global

For information on using the API to access Geocode Address Global, see the geocoding guides.

GeocodeAddressWorld

The GeocodeAddressWorld takes an address located in any of the supported countries and returns the city centroid or, for some countries, postal centroid. GeocodeAddressWorld cannot geocode to the street address level. If you require address-level geocoding, use GeocodeAddressGlobal.

GeocodeAddressWorld is typically used as a fallback geocoder to cover countries for which a Geocode Address Global country is not available. For example, you may have licensed the Australia geocoder because you are primarily interested in geocoding Australian addresses. However, your data may have some records with locations outside Australia. In this case you could use GeocodeAddressWorld to provide centroid geocodes for locations outside Australia, while using the Australia geocoders to provide more precise geocodes for Australian addresses. In other

dataflows, you may choose to use GeocodeAddressWorld as a first pass geocoder and then route the results to country-specific geocoders. The best strategy depends on your business case and the nature of your address data.

GeocodeAddressWorld is an optional part of the Enterprise Geocoding Module. For more information about Enterprise Geocoding Module, see [Enterprise Geocoding Module](#) on page 172.

Adding an Enterprise Geocoding Module Database Resource for World Geocoder

Whenever you install a new database resource or modify an existing database resource you must define it in the Management Console in order for it to become available on your system. This procedure describes how to add or modify a database resource for the Enterprise Geocoding Module for the World geocoder.

To create a Geocode Address World database resource:

1. If you haven't already done so, install the database files on your system. For instructions on installing databases, see the *Spectrum™ Technology Platform Installation Guide*.
2. In Management Console, under **Resources**, choose **Spectrum Databases**.
3. Click the Add button  to create a new database or select an existing database resource then click the Edit button  to change it. You can also create a new database resource by copying an existing one, by clicking the Copy button .
4. If you are creating a new database, enter a name for the database resource in the **Name** field. The name can be anything you choose. If you are creating a new database by copying an existing one, rename the default name as needed. You cannot modify the name of an existing database resource, because any services or jobs that reference the database resource by its original name would fail.
5. In the **Pool size** field, specify the maximum number of concurrent requests you want this database to handle.

The optimal pool size varies by module. You will generally see the best results by setting the pool size between one-half to twice the number of CPUs on the server, with the optimal pool size for most modules being the same as the number of CPUs. For example, if your server has four CPUs you may want to experiment with a pool size between 2 (one-half the number of CPUs) and 8 (twice the number of CPUs) with the optimal size possibly being 4 (the number of CPUs).

6. In the **Module** field, select InternationalGeocoder World.
7. In the **Type** field, select Geocode Address Global.
If you had extracted your .SPD files and placed them in the `\server\app\dataimport` folder, Spectrum would automatically add them to the `\repository\datastorage` folder. You will see a list of datasets in the Add Database screen.
8. Select the dataset(s) you want to add to the database as a resource. Use the Filter text box to search for a dataset when you have a long list.
9. Save the database.

10. If there are any open Enterprise Designer sessions, click the refresh button to see the new stage.

Geocode Precision

GeocodeAddressWorld automatically provides the best geocode possible based on the data you provide on input. If you provide a city and valid postal code, you will receive a postal code centroid. If you provide a city and an invalid postal code, or a city and no postal code, GeocodeAddressWorld will return the geographic centroid of the city.

See [Geographic Geocoding](#) on page 184 and [Postal Geocoding](#) on page 183.

From Management Console, you can select Geographic or Postal geocoding. You can also select Best Match. In both geographic and postal geocoding are possible, the Best Match selection will return a close match geographic candidate if the geographic result is to a city level or better (that is, a G3 or G4 result code). If the geographic result is less accurate than a city level (that is, a G1 or G2 result code), then Best Match may return a postal (Z1 result). If a postal result is not available, then the best available geographic candidate is returned.

See [Geographic Geocoding Result Codes](#) and [Postal Geocoding Result Codes](#).

Postal Geocoding

Geocode Address Geocode Address World can geocode to a postal centroid if postcode information is available from the country. Postcode information can come from any of the data sources (TomTom, GeoNames, or Pitney Bowes). See [Country Postal Data Coverage](#) for a summary of Geocode Address Geocode Address World postal data coverage. Depending on the country, postal geocoding may provide more accurate results than geographic geocoding.

Postal level geocoding is possible if these conditions are met:

- Your input address consists of a valid postcode.
- The data source contains postcode information for the country. Not every country has postcode data.

Geocode Address Geocode Address World may return multiple close matches for postal geocoding. For example, a postcode of 12180 matches Troy NY but the identical postcode occurs in several other countries. If the input is the postcode only, then all those candidates are returned as close matches.

If the input includes geographic address elements (such as country, state, region, or city name), Geocode Address Geocode Address World may be able to use that information to return a more accurate single close match. If you want to use geographic address content to refine your postal geocoding results, consider the following:

Note: Different countries derive their postal data from either the TomTom, GeoNames, or Pitney Bowes sources. Therefore, the available geographic content in the postal data source varies by country. For example, city name (City) is a close match weighting factor for countries that use the GeoNames postal data source, but city name is ignored for countries that use

the TomTom postal data source. See [Data Sources and Coverage](#) for information about the geographic content of the TomTom, GeoNames, and Pitney Bowes data sources.

Postal Geocoding with Geographic Information

In this postal geocoding example, the input address includes a valid postcode of 41012 and the province (StateProvince) of Emilia Romagna. A street address is provided, but this is ignored for postal geocoding.

Fornaci 40
Emilia Romagna
41012

Because the TomTom postal data source for Italy includes StateProvince, the province of Emilia Romagna is considered when evaluating close matches. Therefore, Emilia Romagna, Italy with the matching 41012 postal code is returned as the single close match with a Z1 result code. Candidates with a 41012 postcode from other countries may be returned as non-close candidates. If StateProvince or Country information was not provided on input, then Geocode Address Geocode Address World would return multiple close matches because the five-digit 41012 postcode can be found in a number of countries.

Note: The geographic content must be present in the postal data source in order to refine postal geocoding results. For example, the Italy TomTom postal data source does not include city/town (City). So if you input the city of Carpi with the 41012 postal code, Geocode Address Geocode Address World ignores the city name and returns multiple close matches for the 41012 postal code (unless you also specified the ITA country name). See [Data Sources and Coverage](#) for information about the geographic content of the TomTom, GeoNames, and Pitney Bowes data sources.

Geographic Geocoding

Geocode Address World can geocode to the centroid of an administrative division (such as town or village).

Geocode Address World can geocode to the geographic level if these conditions are met:

- Your input addresses contain accurate geographic information without valid postcode address content in the input. If the address in question includes valid postcode input, then Geocode Address World will attempt postal geocoding.
- The data source contains geographic level information for the country. Geographic information can come from any of the data sources (TomTom, GeoNames, or Pitney Bowes).
- Country name or ISO country codes are not required, but if included, they must be matched. Including the country name may produce better close matches.

Geographic Geocoding to City

In this example, the input address includes the city (City) of Vaihingen an der Enz. The country is not specified in this example. The street address information (street name and number) is ignored for the purposed of geographic geocoding.

Muldenweg 2
Vaihingen an der Enz

Geocode Address World returns a G3 close match candidate. Even though the country was not specified, Geocode Address World identifies one close match in Germany (DEU).

StateProvince: Baden-Württemberg
County: Ludwigsburg
City: Vaihingen an der Enz
Country: DEU
Result Code: G3
X: 8.95948
Y: 48.930059

Geographic Geocoding with Common City Name

In this example, the input address includes the city (City) of Venice. This city name occurs in a number of countries, but the country is not specified on input.

St Marks Plaza
Venice

Geocode Address World selects Venice, Italy as the close match candidate because of its large population (approximately 270,000) and because Venice is the administrative capital of the Veneto region of Italy. A number of non-close matches may also be returned for cities of Venice in other countries. The close match candidate for Venice, ITA is:

StateProvince: Veneto
County: Venezia
City: Venice
Country: ITA
Result Code: G3
X: 12.33878
Y: 45.43434

Geographic Geocoding with State/Province Abbreviation

In this example the input address includes the city name of Rome and GA, which is the abbreviation for the state of Georgia in the USA. See [State or Province Abbreviations](#) on page 191 to see the countries for which state/province abbreviations

are recognized. Because the state abbreviation is used, it is not necessary to specify the country name.

Rome, GA

Geocode Address World considers the StateProvince and returns a close match for Rome, Georgia USA. Even though Rome, Italy is a much larger city and is the capital of Italy, that is returned as a non-close candidate because the StateProvince (GA) that was specified on input

StateProvince: Georgia

County: Floyd

City: Rome

Country: USA

Result Code: G3

X: -85.16467

Y: 34.25704

Geographic Geocoding to Locality

In this example, the input address includes the locality of Altamira and province abbreviation of GRO Geocode Address World recognizes the state abbreviation of GRO, so the country name is not necessary.

City: Altamira

StateProvince: GRO

In this example, Geocode Address World returns a close match to Locality) of Altamira even if Altamira was input as City. The (StateProvince) of GRO is also returned. If Guerrero is entered as StateProvince then Guerrero is returned.

StateProvince: GRO

City: ACAPULCO DE JUÁREZ

Locality: ALTAMIRA

Country: MEX

Result Code: G4

X: 99.87984

Y: 16.87637

Address input can be formatted into separate input fields or input can be unformatted (single line input). Geocoding of unformatted input is shown in [Single Line Input](#) on page 193.

Geographic Areas

Every country has administrative divisions and many of these administrative areas are used in addresses. Geocode Address World identifies four AreaNames, each one corresponding to an administrative division. Administrative division naming and hierarchy vary by country.

- locality

- city
- county
- state/province

Geocoding Scenarios

You can use Enterprise Manager to create dataflows that are appropriate for your business requirements and for the nature and quality of your data.

Multiple Country Stage with Geocode Address World as Last Geocoding Pass

You may be able to optimize your results by geocoding your input in several passes. In general, you can use more strict matching criteria in the first pass. In subsequent geocoding passes, you can apply less restrictive matching criteria to any addresses that previously failed to return a close match candidate. This strategy can produce accurate matches for your high-quality addresses and still give you the best possible matches for less accurate addresses, or for addresses in countries that do not have a comprehensive level of coverage.

Let's assume the following scenario:

- Your input file includes addresses for six countries: Argentina (ARG), Brazil (BRA), Mexico (MEX), Chile (CHL), Venezuela (VEN), and Panama (PAN).
 - You have geocoders for three of these countries (ARG, BRA, and MEX) are deployed in a multiple country stage.
 - Geocode Address World is deployed in a separate stage to geocode addresses that could not be identified by the country-specific geocoders.
 - Your stage uses conditional routers (and optionally stream combiner) to manage the geocoding flow.
1. Read input into the multiple-country stage. Geocoded addresses can be written out to a file or optionally sent to the stream combiner.
 2. Some Addresses that could not be geocoded in step 1. This may be because they were addresses from CHL, VEN, or PAN, and you do not have geocoders for these countries in the first stage. Or they may have failed to return a close match candidate in the first stage because of input errors or ambiguities in the addresses. These ungeocoded addresses are sent to the Geocode Address World stage.
 3. Addresses can be geocoded to postal or geographic accuracy by Geocode Address World. Successfully geocoded addresses can be written out to a file or optionally sent to the stream combiner.

Postal geocoded candidates will have a Z1 result code. Postal geocoded results may be very accurate in countries with robust postcode systems. See [Postal Geocoding](#) on page 183. Geographic candidates will have a G result code (for example G3 for a town/city match). See [Geographic Geocoding](#) on page 184.

4. The stream combiner (if used in your dataflow) can combine all geocoded addresses and write them to a file or direct them for further processing.

This is one scenario. You could use Enterprise Manager to design more complex dataflows that are suitable for your needs.

Using Geocode Address World as First Geocoding Pass

You could also use a strategy with Geocode Address World as the first geocoding pass.

Assume the following:

- Your addresses typically do not specify a country (although some may).
- Some addresses contain only street and city address information.
- You have country-specific geocoders for some countries, but not all.
- You use a main dataflow with subflows to manage the geocoding process.

Use a dataflow (possibly with subflows) that perform the following actions. Note that these steps illustrate a simplified view of a sample dataflow.

1. Read input into the multiple-country stage that also includes Geocode Address World. Based on city name (and possibly state name for USA addresses), each address can produce one or more potential close match candidates for several different countries. Each candidate will now be associated with a country, even though the input address may not have included a country.
2. If a country-specific geocoder is available, the candidate is sent to that geocoder. This processing involves conditional routing, stream combiners, and other Spectrum™ Technology Platform control stages. Depending on the completeness of the input address and capabilities of the country-specific geocoder, candidates may be geocoded to a street (S result code), geographic (G result code), or postal (Z result code) level.
3. If no country-specific geocoder is available, the candidate is routed to Geocode Address World, where candidates can be geocoded to a geographic or postal level.
4. Candidates from all subflows are combined and ranked using a number of criteria. Ranking could be based on population of the city (city rank), accuracy of the match (street, geographic, postal), proximity to a user's locality, or other criteria.

Input

GeocodeAddressWorld takes an address as input. To obtain the best performance and the most possible matches, your input address lists should be as complete as possible, free of misspellings and incomplete addresses, and as close to postal authority standards as possible. Most postal authorities have websites that contain information about address standards for their particular country.

Note: The country name or two- or three- character country ISO code is optional. If you omit the country, GeocodeAddressWorld returns the best available candidates based on the other input provided.

Input Fields

The following table provides information on the format and layout of GeocodeAddressWorld input.

Note: Specify input using the `DataTable` class. For more information, see the Spectrum™ Technology Platform API Guide.

Table 24: GeocodeAddressWorld Input Data

columnName	Format	Description
AddressLine1	String	The first address line. For example, 4360 DUKES RD: 4360 DUKES RD KALGOORLIE WA 6430
AddressLine2	String	The second address line of a two-line address. For example, Level 6 51 Jacobson St: 26 WELLINGTON ST E SUITE 500 TORONTO ON M5E 1S2 This field is not used in Australia, Austria, Belgium, Brazil, Denmark, Finland, France, Germany, Ireland, Italy, Liechtenstein, Luxembourg, Malaysia, The Netherlands, Poland, Portugal, Spain, Sweden, Switzerland, and Thailand.
City	String	The city or town name. Your input address should use the official city name. This will produce the best geocoding results. For Thailand, this field contains the subdistrict (tambon).
County	String	The name of one of the following depending on the country: <ul style="list-style-type: none"> • Not used—AUT, BRA, CAN, FIN, GBR, MYS, PRT, SGP. • Department—FRA • District (amphoe)—THA • District (fylke/counties)—NOR • District (powiat)—POL • Kommun—SWE • Kreis—DEU • Local Government Authority (LGA)—AUS • Province—BEL, CHE, DNK, ESP, IRL, ITA, LIE, LUX, NLD • Region—NZL

columnName	Format	Description
FirmName	String	Company or name or place name. For example, PITNEY BOWES. PITNEY BOWES 4360 DUKES RD KALGOORLIE WA 6430
LastLine	String	The last line of the address. For example, KALGOORLIE WA 6430: 4360 DUKES RD KALGOORLIE WA 6430
Locality	String	The name of one of the following depending on the country: <ul style="list-style-type: none"> • Not used—AUS, AUT, BEL, CHE, DEU, DNK, FIN, FRA, IRL, LIE, LUX, MYS, NLD, NOR, POL, SGP, SWE, THA • Dissemination Area and Enumeration Area (DA and EA)—CAN • Locality—BRA, GBR, ITA, PRT • Suburb—NZL
PostalCode	String	The postal code in the appropriate format for the country.
StateProvince	String	The name of one of the following depending on the country: <ul style="list-style-type: none"> • Not used—BEL, CHE, DNK, IRL, LIE, LUX, NLD, NOR, SGP • Bundesland—DEU • Province—CAN • Province (changwat)—THA • Province (voivodship)—POL • Region—AUT, ESP, FRA, GBR, NZL, PRT • Region (län)—FIN • Region (lan)—SWE • State—AUS, BRA • State (negeri)—MYS
Country	String	The two- or three-character ISO country code. This field is optional. If you omit the country, GeocodeAddressWorld returns the best available candidates based on the other input provided For a list of ISO codes, see ISO Country Codes and Module Support on page 788.

Address Aliases

Some countries have alternative administrative names. For example, there may be an official name for a city or town, but there may also be common but unofficial alternative name for the same city

or town. If alias information is available in the source data, Geocode Address World includes this alias in the database. This enables Geocode Address World to geocode successfully when alternative names are used in input addresses.

[Language Aliases](#) on page 191 are also supported.

Language Aliases

Some countries have more than one official or prominent language. For example, the same town may be commonly known by both German and Italian names. If language alias information is available in the source data, Geocode Address World uses this in the database. This enables Geocode Address World to geocode successfully when alternative language names are used in input addresses.

Aliases can exist for all administrative levels, from StateProvince state/province to Locality locality. See [Administrative Divisions and Postal Codes](#) on page 192 for a description of administrative levels associated with the geographic data.

[Address Aliases](#) on page 190 are also supported for commonly used, alternative administrative areas.

State or Province Abbreviations

In some countries, the state or province is an important part of the address and often this address element is abbreviated. For selected countries, these state/province abbreviations are recognized by Geocode Address World. For example, in the United States each state has a two-letter abbreviation (such as CA for California). Similarly, Netherlands, state abbreviations (such as GLD for Gelderland) are recognized.

Geocode Address World accepts state/province abbreviations for the following countries:

Table 25: Country State/Province Abbreviation Support

Country Name	State Or Province Division	Example
Australia (AUS)	StateProvince (State)	NSW (abbreviation for New South Wales)
Canada (CAN)	StateProvince (Province)	AB (abbreviation for Alberta)
Italy (ITA)	County (Province)	MO (abbreviation for Modena)
Mexico (MEX)	StateProvince (State)	JA (abbreviation for Jalisco)
Netherlands (NLD)	County (State)	FR (abbreviation for Friesland)
United States (USA)	StateProvince (State)	CA (abbreviation for California)

Geocode Address World evaluates these state or province abbreviations to better identify close matches. See [Geographic Geocoding with State/Province Abbreviation](#) on page 185 for an example that illustrates this feature.

Administrative Divisions and Postal Codes

Typical input addresses consist of street address, administrative division, and postal code information. Geocode Address World uses the administrative divisions and postal codes for geographic or postal geocoding.

- StateProvince (state or province)
- County (county, region, or district)
- City (town or city)
- Locality (locality suburb, or village)
- postal code

Specific administrative divisions vary by country. For example, Locality may contain locality, suburb, or barrio, depending on the country. StateProvince may contain state, province, region, or some other name depending on the country. See [State or Province Abbreviations](#) on page 191 for more information about how state/province abbreviations are interpreted by Geocode Address World.

Not all administrative divisions are used in addressing conventions for all countries. For example, in the USA, County (county) is not typically used in addresses. But for some countries, County is an important part of the address.

If your input data includes postal codes, Geocode Address World can use this for postal geocoding, assuming that the source data includes postal data for the specific country.

Input Recommendations

You can optimize Geocode Address World results if you prepare and understand your input records. Follow these guidelines :

- Ensure that your input addresses are as complete and accurate as possible. If there are errors in your input addresses, Geocode Address World may still be able to geocode those addresses, but there may be more than one possible match or you may get non-close matches. If you can verify and correct any incomplete or inaccurate input addresses, you can get better results.
- Include postcodes in your input addresses if you have them. This is not required, but it allows Geocode Address World to perform postal geocoding. This may give you more accurate results for some addresses, depending on the country and on the completeness and accuracy of other address elements
- Include the country name or official three-character or two-character country ISO code in your input addresses. This is not required, but it may help Geocode Address World distinguish between similar addresses and city names that may occur in different countries.
- Format your input addresses consistently. Geocode Address World can handle input addresses in a wide variety of input formats, or can handle unformatted (single line) input. But you can get more accurate and faster results if your input addresses are consistently formatted and conform to country-specific address conventions. Even if your input address are single line (unformatted),

you may get better results and performance if the address elements are ordered consistently. Use the AddressLine1 input area for unformatted addresses. See [Single Line Input](#) on page 193

Single Line Input

Address input can be formatted into separate input fields or input can as single line input. Use AddressLine1 to enter single line input.

Single Line Geographic Geocoding

In this example, unformatted (single line) input is used. Geocode Address World analyzes single line input to identify the geographic address elements (Graz in this example), and then geocodes to a geographic centroid. The MainAddress (street information) is not used.

Sackstraße 10 Graz

Geocode Address World returns a geographic close match candidate based on an City match. Even though the country was not specified, Geocode Address World identifies the close match in Austria (AUT).

StateProvince: Steirmark

County: Graz (Stadt)

City: Graz

Country: AUT

Result Code: G3

X: 15.44172

Y: 47.06792

If your input addresses are accurate, unformatted input can produce a match rate comparable to that of formatted input. However, geocoding unformatted addresses typically has slower performance than geocoding formatted addresses.

Single Line Postal Geocoding with Country Specified

In this example, single line input is used and a postcode is provided. The country Austria (AUT) is also specified. The street address is also input, but this is ignored by Austria.

Alpenstraße 117 5020 AUT

Austria returns a postal centroid close match candidate (Z1 result code). Because the country (AUT) is specified in the input, the country must be matched and a single close match for that postal code in Austria is returned. Non-close matches with the 5020 postal code from other countries are also returned.

StateProvince: Salzburg

Country: AUT

Postcode: 5020

Result Code: Z1

X: 13.04685 Y: 47.80262

Options

Geocoding Options

The following table lists the options that control how a location's coordinates are determined.

Table 26: Geocoding Options

optionName	Description
CoordinateSystem	<p>A coordinate system is a reference system for the unique location of a point in space. Cartesian (planar) and Geodetic (geographical) coordinates are examples of reference systems based on Euclidean geometry. Spectrum™ Technology Platform supports systems recognized by the European Petroleum Survey Group (EPSG).</p> <p>One the following:</p> <p>EPSG:4283 Also known as the GDA94 coordinate system.</p> <p>EPSG:4326 Also known as the WGS84 coordinate system. Default.</p>

Matching Options

Table 27: Matching Options

optionName	Description
KeepMultimatch	<p>Specifies whether to return results when the address matches to multiple candidates in the database. If this option is not selected, an address that results in multiple candidates will fail to geocode.</p> <p>If you select this option, specify the maximum number of candidates to return using the MaxCandidates option (see below).</p> <p>Y Yes, return candidates when multiple candidates are found. Default.</p> <p>N No, do not return candidates. Addresses that result in multiple candidates will fail to geocode.</p>

optionName	Description
MaxCandidates	<p>If you specify KeepMultimatch=Y, this option specifies the maximum number of results to return.</p> <p>The default is 1.</p>
CloseMatchesOnly	<p>Specifies whether to return only those geocoded results that are close match candidates. For example, if there are 10 candidates and two of them are close candidates, and you enable this option, only the two close matching candidates would be returned instead of all 10.</p> <p>Y Yes, return only close matches.</p> <p>N No, do not return only close matches. Default.</p>

Data Options

The Data tab allows you to specify which databases to use in geocoding. Databases contain the address and geocode data necessary to determine the geocode for a given address. The data is based on address and geocoding data from postal authorities and suppliers of geographical data.

Note: As the EGM Module transitions its administrative tasks to a web-based Management Console, labels for the options may use different wording than what you see in Enterprise Designer. There is no difference in behavior.

Table 28: Data Options

optionName	Description
DatabaseSearchOrder	<p>The name of one or more database resources to use in the search process. Use the database name specified in the Management Console's Spectrum Databases page. tool. For more information, see the <i>Spectrum™ Technology Platform Administration Guide</i>.</p> <p>You can specify multiple database resources. If you specify more than one database, list them in order of preference. The order of the databases has an effect when there are close match candidates from different databases. The close matches that are returned come from the database that is first in the search list. Close matches from lower ranked databases are demoted to non-close matches.</p>

Output

GeocodeAddressWorld returns the latitude/longitude, city, county, and result indicators. Result indicators describe how well the geocoder matched the input to a known location and assigned a latitude/longitude; they also describe the overall status of a match attempt. The information is returned in upper case.

If you are using the API, the output returned is in the `DataTable` class. For more information, see the Spectrum™ Technology Platform API Guide.

Address Output

Table 29: Address Output

columnName	Description
City	Municipality name.
CityRank	CityRank is a numeric value ranging from 1 (high) to 10 (low) based on total and relative population, importance, and other criteria.
Country	The three-letter ISO 3166-1 Alpha 3 country code. The two-letter code can also be used. See Country Geographic Data Coverage for a list of countries and data sources for geographic geocoding. See Country Postal Data Coverage for a list of postal geocoding countries and data sources.

columnName	Description
County	<p>This field contains an area that is smaller than a state/province but larger than a city. The specific area varies by country:</p> <ul style="list-style-type: none">• AUS—Local Government Authority (LGA)• AUT—Province• BEL—Province• BHS—Not used• BRA—Not used• CAN—Not used• CHE—Province• DEU—Kreis• DNK—Province• FIN—Province (kommune)• FRA—Department• GBR—County• ITA—Province• LIE—Province• LUX—Province• MYS—District (daerah)• NLD—Province• NZL—Not used• POL—District (powiat)• PRT—Not used• SGP—District• SWE—Region (kommun)• THA—District (amphoe)
PostalCode	<p>The postal code for the address. The format of the postcode varies by country.</p>

columnName	Description
StateProvince	<p>The meaning of StateProvince varies by country:</p> <ul style="list-style-type: none"> • AUS—State • AUT—Region • BEL—Not used • BRA—State • CAN—Province • CHE—State • DEU—Bundesland • DNK—Not used • ESP—Region • FIN—Region (län) • FRA—Region • GBR—Region • IRL—Not used • ITA—Region • LIE—State • LUX—Not used • MYS—State (negeri) • NLD—Not used • NOR—Not used • NZL—Region • POL—Province (voivodship) • PRT—Region • SGP—Not used • SWE—Region (lan) • THA—Province (changwat)

Geocode Output

Table 30: Geocode Output

columnName	Description
CoordinateSystem	The coordinate system used to determine the latitude and longitude coordinates. A coordinate system specifies a map projection, coordinate units and more. An example is EPSG:4326. EPSG stands for European Petroleum Survey Group.
Latitude	Seven-digit number in degrees and calculated to four decimal places (in the format specified).

columnName	Description
Longitude	Seven-digit number in degrees and calculated to four decimal places (in the format specified).

Result Codes

Result codes contain information about the success or failure of the geocoding attempt, as well as information about the accuracy of the geocode.

Table 31: Result Code Output

columnName	Description
Geocoder.MatchCode	Indicates how closely the input address matches the candidate address.
IsCloseMatch	Indicates whether or not the address is considered a close match. An address is considered close based on the "Close match criteria" options on the Matching tab. Y Yes, the address is a close match. N No, the address is not a close match.
MultiMatchCount	For street address geocoding, the number of matching address positions found for the specified address. For intersection geocoding, the number of matching street intersection positions found for the specified addresses.
Status	Reports the success or failure of the match attempt null Success F Failure

columnName	Description										
Status.Code	<p>If the geocoder could not process the address, this field will show the reason.</p> <ul style="list-style-type: none"> • Internal System Error • No Geocode Found • Insufficient Input Data • Multiple Matches Found • Exception occurred • Unable to initialize Geocoder • No Match Found 										
Status.Description	<p>If the geocoder could not process the address, this field will show a description of the failure.</p> <table border="0"> <tr> <td>Problem + explanation</td> <td>Returned when Status.Code = Internal System Error.</td> </tr> <tr> <td>Geocoding Failed</td> <td>Returned when Status.Code = No Geocode Found.</td> </tr> <tr> <td>No location returned</td> <td>Returned when Status.Code = No Geocode Found.</td> </tr> <tr> <td>No Candidates Returned</td> <td>The geocoder could not identify any candidate matches for the address.</td> </tr> <tr> <td>Multiple Candidates Returned and Keep Multiple Matches not selected</td> <td>The address resulted in multiple candidates. In order for the candidate address to be returned, you must specify <code>KeepMultimatch=Y</code>.</td> </tr> </table>	Problem + explanation	Returned when Status.Code = Internal System Error.	Geocoding Failed	Returned when Status.Code = No Geocode Found.	No location returned	Returned when Status.Code = No Geocode Found.	No Candidates Returned	The geocoder could not identify any candidate matches for the address.	Multiple Candidates Returned and Keep Multiple Matches not selected	The address resulted in multiple candidates. In order for the candidate address to be returned, you must specify <code>KeepMultimatch=Y</code> .
Problem + explanation	Returned when Status.Code = Internal System Error.										
Geocoding Failed	Returned when Status.Code = No Geocode Found.										
No location returned	Returned when Status.Code = No Geocode Found.										
No Candidates Returned	The geocoder could not identify any candidate matches for the address.										
Multiple Candidates Returned and Keep Multiple Matches not selected	The address resulted in multiple candidates. In order for the candidate address to be returned, you must specify <code>KeepMultimatch=Y</code> .										

columnName	Description
LocationPrecision	<p>A code describing the precision of the geocode. One of the following:</p> <p>0 No coordinate information is available for this candidate address.</p> <p>1 Interpolated street address.</p> <p>2 Street segment midpoint.</p> <p>3 Postal code 1 centroid.</p> <p>4 Partial postal code 2 centroid.</p> <p>5 Postal code 2 centroid.</p> <p>6 Intersection.</p> <p>7 Point of interest. This is a placeholder value. Spectrum databases do not have POI data, so it is not possible to get this return.</p> <p>8 State/province centroid.</p> <p>9 County centroid.</p> <p>10 City centroid.</p> <p>11 Locality centroid.</p> <p>12 - 15 (LocationPrecision codes) For most countries, LocationPrecision codes 12 through 15 are reserved for unspecified custom items.</p> <p>13 Additional point precision for unspecified custom item.</p> <p>14 Additional point precision for unspecified custom item.</p> <p>15 Additional point precision for unspecified custom item.</p> <p>16 The result is an address point.</p> <p>17 The result was generated by using address point data to modify the candidates segment data.</p> <p>18 The result is an address point that was projected using the centerline offset feature. You must have both a point and a street range database to use the centerline offset feature, and thereby return LocationPrecision 18.</p>
StreetDataType	<p>The default search order rank of the database used to geocode the address. A value of "1" indicates that the database is first in the default search order, "2" indicates that the database is second in the default search order, and so on.</p>

Geographic Candidate Ranking

Identical geographic area names can be found in many countries. When this occurs, Geocode Address World uses a ranking system to determine which of potential candidates is the most likely close match.

The specific details of this weighted ranking depend somewhat on the data source (TomTom, GeoNames, or Pitney Bowes source), but the following criteria are weighted to determine the most likely close match candidate.

- country capital
- administrative area (state/province, regional, county) capital
- population range

Country capital status outweighs any other geographic ranking criteria. For example, San Juan entered as City returns San Juan, Puerto Rico (PRI) as the close match because it is the capital of PRI. Other San Juan cities in the world (including Spain, Costa Rica, Dominican Republic and Philippines) can be returned as non-close matches regardless of their population. To return matches, you must check the Keep multiple matches check box in Matching Options of the Management Console, and specify the number of matches you want to return.

Similarly, Geocode Address World returns Roma, ITA as a close match since that is the capital of Italy, but Roma in Romania, Honduras, and Panama are returned as non-close matches.

State/province administrative capitals are highly weighted even if their populations are not very large. For example, Springfield returns a close geographic match to Springfield, Illinois USA because this is the state capital of Illinois. Springfield, Massachusetts has a somewhat larger population, but this is outweighed by the state capital status of Springfield Illinois. Other less populous Springfield communities in the USA and other countries are also returned as close matches, but are listed below the Springfield Illinois candidate. It is possible for a large city to rate as an equal close match along with a smaller, identically named state/province capital. However, the state/province capital will not be demoted, even if it has a relatively small population.

Similarly, if your input is Albany in City with no country specified, Geocode Address World returns Albany, NY, USA as the close match candidate. This is because Albany is the capital of New York State, and therefore gets a high ranking as administrative area capital. The population is also a contributing ranking factor. If you specify the city of Albany with a different country, such as New Zealand, then the country is used and Albany, NZL is returned as the close match candidate.

If a candidate includes a city, a CityRank value is also returned, if available. CityRank is a numeric value ranging from 1 (high) to 10 (low) that indicates the relative ranking of the city. This ranking is based on relative population, administrative status, and other criteria. If multiple geographic candidates are returned, they are listed in city rank order.

Match Codes

Matches in the G category indicate that the candidate is located at the geographic centroid with the following possible accuracy levels. Not all levels of accuracy are possible for all countries.

- **G0**—Country centroid. This is not returned for GeocodeAddressWorld.
- **G1**—State or province centroid. For Japan, this indicates a prefecture (ken) match.

- **G2**—County centroid. For Japan, this indicates a city (shi) match.
- **G3**—City centroid. For Japan, this indicates a municipality subdivision or sub-city (oaza) match. For Australia, Local Government Authority (LGA) information can be returned from the Street Range Address Database only (not the G-NAF database).
- **G4**—Locality centroid. For Japan, this indicates a city district (chome) match.

Matches in the Z category indicate that no street match was made for one of the following reasons:

- You specified to match to postal code centroids. The resulting point is located at the postal code centroid with four possible accuracy levels.
- There is no close match and you specified to fall back to postal code centroid

The Z category contains the following accuracy levels:

- **Z0**—Postal Code match, no coordinates available (rare occurrence).
- **Z1**—Postal Code centroid match.
- **Z3**—Full postal code centroid match. For Canada, this is an FSALDU centroid.
- **Z6**—Postal Code centroid match for point ZIP.

GeocodeUSAddress

GeocodeUSAddress takes an address and returns latitude/longitude coordinates. GeocodeUSAddress also standardizes and validates addresses using data from the U.S. Postal Service.

GeocodeUSAddress can also geocode intersections. Instead of entering a mailing address, you can enter an intersection such as "Pearl St. and 28th" and obtain the coordinates of the intersection.

GeocodeUSAddress is part of the Enterprise Geocoding Module. For more information about the Enterprise Geocoding Module, see [Enterprise Geocoding Module](#) on page 172.

GeocodeUSAddress

Input

GeocodeUSAddress takes an address as input. To obtain the best performance with GeocodeUSAddress and the most possible matches, your input address should be as complete as possible and free of misspellings and incomplete information. Input addresses should be as close to USPS standards as possible for the highest match rate. For information about USPS standards, see the USPS website <http://www.usps.com>.

Input addresses should contain a street address line and a lastline, or a single line with both address and lastline elements. This helps GeocodeUSAddress accurately identify an area in which to search for a match candidate, based on the city, state, and ZIP Code. However, matching can still be performed in cases where only a city is input in the lastline rather than a full lastline containing the city, state and ZIP Code elements. For more information, see [City-only Lastline Matching](#) on page 208.

GeocodeUSAddress also accepts a street address line with individual city, state, and ZIP Code lines instead of a last line. You should only use this type of input if you are confident that the input address is free of misspellings and incomplete information.

If you are using Geocode US Address for address standardization, input addresses must have at least a street name, and either a city and state or a ZIP Code to obtain a match. If you are using Geocode US Address to obtain geocoding information, input addresses only need to contain a ZIP + 4 Code to receive geocoding information.

The following table summarizes the address formats and input address field(s) used for each address matching methodology.

Address Matching Methodology	Address Format	Notes
Standard Input	AddressLine1	
	AddressLine2	Optional.
	LastLine or City, State, PostalCode	
Single-line	AddressLine1	Contains address elements in a single line. The minimum information required in the last line component is a ZIP Code or a valid city and state combination.
City-only Lastline	AddressLine1	
	AddressLine2	Optional.
	LastLine or City	Contains only the city.

Address Matching Methodology	Address Format	Notes
Multi-line		<p>The address elements are separated into multiple lines. Recommended only for use with free-form address data entry.</p> <p>Important: The multi-line format cannot use the <code>LastLine</code> field or the parsed last line element fields: <code>City</code>, <code>State</code>, or <code>PostalCode</code>.</p>
	AddressLine1	
	AddressLine2	
	AddressLine3	
	AddressLine4	Optional.
	AddressLine5	Optional.
	AddressLine6	Optional.

The following table provides information about the format and layout of GeocodeUSAddress input.

GeocodeUSAddress Input Data

columnName	Format	Description
AddressLine1	String	<p>The first address line or a street intersection.</p> <p>To specify a street intersection, use and, &, at, or @. For example, PEARL & 28th. GeocodeUSAddress does not match intersections when processing in CASS mode.</p> <p>You may enter an address range instead of an individual address number. For example, 10-12 FRONT ST. For additional information, see Address Range Matching on page 209.</p>
AddressLine2	String	<p>The second address line or a street intersection.</p> <p>To specify a street intersection, use and, &, at, or @. For example, PEARL & 28th. GeocodeUSAddress does not match intersections when processing in CASS mode.</p>

columnName	Format	Description
AddressLine3	String	Third address line.
AddressLine4	String	Fourth address line.
AddressLine5	String	Fifth address line.
AddressLine6	String	Sixth address line.
City	String	The name of the municipality, such as a city or town. Note: If there is any data in the input fields AddressLine3, AddressLine4, AddressLine5, or AddressLine6, GeocodeUSAddress will ignore data in the City input field.
FirmName	String	The name of a business. The geocoding process attempts to match the input firm name to the recognized firm names in the USPS data for a higher quality match. If the firm name is not in the USPS data, the firm name is ignored when matching and is returned with the output.
LastLine	String	The last line of an address containing the city, state, and ZIP Code.
Latitude	String	Input latitude for matching using the Predictive Lastline feature. The required input format is an integer value; for example, 40018301. Decimal is not a valid input format. For more information, see Predictive Lastline on page 210.
Longitude	String	Input longitude for matching using the Predictive Lastline feature. The required input format is an integer value; for example: -105240976. Decimal is not a valid input format. For more information, see Predictive Lastline on page 210.
PostalCode	String	The 5-digit ZIP Code or the 9-digit ZIP + 4 code. Note: If there is any data in the input fields AddressLine3, AddressLine4, AddressLine5, or AddressLine6, GeocodeUSAddress will ignore data in the PostalCode input field.

columnName	Format	Description
StateProvince	String	The name or abbreviation of the state. Note: If there is any data in the input fields AddressLine3, AddressLine4, AddressLine5, or AddressLine6, GeocodeUSAddress will ignore data in the StateProvince input field.

How GeocodeUSAddress Processes Addresses

GeocodeUSAddress processes addresses in the following order:

1. Parses the address elements.

GeocodeUSAddress parses input address data into single elements. Parsing occurs on data in the order in which you load the data. Even if a valid address is missing an element, GeocodeUSAddress can find a match. Some elements, such as predirectionals, may not be critical elements of some addresses. By comparing an address as input against all known addresses in a search area, GeocodeUSAddress can usually determine if any of these elements are missing or incorrect.

2. Finds possible matches within the search area.

GeocodeUSAddress uses the last line elements of an address to determine a search area. You can specify if you want the search area based on a finance area or on an area defined by the city, state, and ZIP Code. (A Finance Area is a collection of ZIP Codes within a contiguous geographic region.) If the city and state are not in the ZIP Code, GeocodeUSAddress performs separate searches for the ZIP Code and city.

After GeocodeUSAddress has determined the search area, it tries to match the elements from the street address line to the records in the standardized data files and does the following:

- Checks input address ranges for missing or misplaced hyphens, and alpha-numeric ranges for proper sequence.
- Searches for any misspellings and standard abbreviations. For example, the GeocodeUSAddress can recognize Mane for Main and KC for Kansas City.
- Searches for any alias matches to the USPS and Spatial data (TIGER and TomTom). For example, GeocodeUSAddress recognizes that in Boulder, CO Highway 36 is know as 28th Street.
- Searches for any USPS recognized firm names for additional match verification.
- Searches for street intersection matches. Matching to an intersection is extremely useful when you are using address matching to obtain a geocode.
- Searches for addresses lines that contain a house number and unit number as the same element. For example, GeocodeUSAddress recognizes the input 4750-200 Walnut Street and performs recombination to output 4750 WALNUT ST STE 200.

Note: The USPS does not consider intersections valid addresses for postal delivery. Therefore, the GeocodeUSAddress does not match intersections when processing in CASS mode.

3. Scores each possible match against the parsed input.

GeocodeUSAddress compares each element in the input address to the corresponding element in the match candidates, and assigns a confidence level. GeocodeUSAddress weighs the confidence level for all of the elements within a match candidate, and assigns a final score to the sum.

Note: GeocodeUSAddress uses a penalty scoring system. If an element does not exactly match an element in the match candidate, the GeocodeUSAddress adds a penalty to the score of the match candidate. Therefore, scores with lower numbers are better matches.

4. Determines the match.

GeocodeUSAddress prioritizes each match candidate based on the assigned confidence score and returns as a match the candidate that has the lowest score.

The match mode you choose determines the range that GeocodeUSAddress allows for a match. GeocodeUSAddress only returns a match if the score of the target address falls within the range designated by the selected match mode.

In some cases, more than one match candidate may have the lowest score. In this instance, GeocodeUSAddress cannot determine on its own which record is correct, and returns a status indicating multiple matches.

Note: If you have enabled Delivery Point Validation (DPV) processing, GeocodeUSAddress automatically attempts to resolve multiple matches using DPV.

Along with a standardized address, GeocodeUSAddress also returns the following:

- Geocode—Longitude and latitude for the address
- Match code—Information about the match of the input address to the reference data
- Location code—Precision level of a geocode
- Parity—The side of the street on which the match resides.

GeocodeUSAddress does not return parity when processing in relaxed mode. For more information about GeocodeUSAddress output, see [Output](#) on page 237.

City-only Lastline Matching

City-only lastline matching permits address matching with only a city in the input lastline. The city should be provided using either the `AddressLine1` (using single-line address input), `AddressLine2`, `LastLine` or `City` input fields.

With city-only lastline input, all of the states are searched in which the input city exists. Therefore, there is the possibility of an increase in multimatches (return of E023 or E030 Match Codes) when matching with city-only input instead of city+state input.

Restrictions:

- City-only lastline input matching is not supported in CASS mode.
- City-only lastline is not supported when matching to User Dictionaries.
- When matching using city-only lastline, the PreferZipCodeOverCity setting is ignored
- It is strongly recommended to not use city-only lastline matching in Relaxed match mode to avoid the return of false-positive matches.

Address Range Matching

Some business locations are identified by address ranges. For example, a shopping plaza could be addressed as 10-12 Front St. This is how business mail is typically addressed to such a business location. These address ranges can be geocoded to the interpolated mid-point of the range.

Address ranges are different from hyphenated (dashed) addresses that occur in some metropolitan areas. For example, a hyphenated address in Queens County (New York City) could be 243-20 147 Ave. This represents a single residence (rather than an address range) and is geocoded as a single address. If a hyphenated address returns as an exact match, GeocodeUSAddress does not attempt to obtain an address range match.

Address range matching is not available in Exact or CASS modes, since an address range is not an actual, mailable USPS® address. The following fields are not returned by address range geocoding:

- ZIP + 4® (in multiple segment cases)
- Delivery point
- Check digit
- Carrier route
- Record type
- Multi-unit
- Default flag

Address range matching works within the following guidelines:

- There must be two numbers separated by a hyphen.
- The first number must be lower than the second number.
- Both numbers must be of the same parity (odd or even) unless the address range itself has mixed odd and even addresses.
- Numbers can be on the same street segment or can be on two different segments. The segments do not have to be contiguous.
- If both numbers are on the same street segment, the geocoded point is interpolated to the approximate mid-point of the range.
- If the numbers are on two different segments, the geocoded point is based on the last valid house number of the first segment. The ZIP Code and FIPS Code are based on the first segment.
- In all cases, odd/even parity is evaluated to place the point on the correct side of the street.

Predictive Lastline

Predictive lastline allows you to match an address when only an input street address and latitude/longitude coordinates are provided, rather than the traditional street address with lastline input. For example, an input of 4750 Walnut with latitude/longitude coordinates located in Boulder, will return full address information.

Additional feature information

- Predictive Lastline uses a search radius of 150 feet.
- Predictive Lastline is disabled by default.
- When Predictive Lastline is not enabled, if a singleline address is provided, any input latitude and longitude values are ignored and the input address is geocoded.
- If the input latitude/longitude coordinates fall near the borders of multiple cities, the Enterprise Geocoding Module processes all cities and returns the results of the best match. If the results are determined as equal, then a multi-match is returned.
- Predictive lastline does not require a license for reverse geocoding.
- This feature will work with any type of dataset.

optionName	Description
PredictiveLastLine	Specifies whether GeocodeUSAddress should match using the street address and input latitude/longitude coordinates, rather than the traditional street address with lastline input.
	Y Enable Predictive Lastline processing.
	N Disable Predictive Lastline processing. Default.

Enabling Predictive Lastline

The following procedure describes how to enable and set up the Predictive Lastline feature.

1. `Set PredictiveLastLine = Y`
2. `Set Latitude = integer value`
3. `Set Longitude = integer value`
4. `Set AddressLine1 = input street address`

Options

Geocoding Options

GeocodeUSAddress Geocoding Options

The following table lists the options that control how a location's coordinates are determined.

optionName	Description
Dataset	The name of the database resource that contains the data to use in the search process. Use the database name specified in Management Console's Spectrum Databases page.
Offset	<p data-bbox="600 499 1429 562">Specifies the offset distance from the street segments, in feet. The range is 0 to 5280. Default = 50 feet.</p> <p data-bbox="600 573 1429 934">The offset distance is used in street-level geocoding to prevent the geocode from being in the middle of a street. It compensates for the fact that street-level geocoding returns a latitude and longitude point in the center of the street where the address is located. Since the building represented by an address is not on the street itself, you do not want the geocode for an address to be a point on the street. Instead, you want the geocode to represent the location of the building which sits next to the street. For example, an offset of 40 feet means that the geocode will represent a point 40 feet back from the center of the street. The distance is calculated perpendicular to the portion of the street segment for the address. Offset is also used to prevent addresses across the street from each other from being given the same point. The diagram below shows an offset point in relation to the original point.</p>  <p data-bbox="600 1291 1429 1354">Street coordinates are accurate to 10,000ths of a degree and interpolated points are accurate to the millionths of a degree.</p>

optionName	Description
------------	-------------

Squeeze	<p>Specifies the distance, in feet, to move the street segment end points toward the middle of the segment. Squeeze is used in street-level matching. Use the squeeze setting to prevent address points from residing in an intersection or too close to the end of a street.</p> <p>The range is 0 to 2147483647. Default = 50 feet.</p> <p>The following diagram compares the end points of a street to squeezed end points.</p>
---------	--

Squeezing the street segment endpoints affects street-level matching by reducing the length of a street segment, thereby reducing the spacing between address points along the segment. For example, if the length of a street segment is 1,000 feet and there are 10 addresses along the segment, street-level matching would result in each address being spaced 100 feet apart ($1,000 \div 10$). If you were to set a squeeze value of 100 feet, moving each street segment endpoint 100 feet forward the center of the street segment, the length of the street segment would be reduced to 800 feet (reduced by 100 feet on each end). Street-level matching would then result in addresses being spaced 80 feet apart ($800 \div 10$).

LatLonFormat	<p>Specifies the format of the latitude/longitude returned by the geocoder.</p> <p>Decimal The latitude/longitude is returned in decimal format. Default. For example: 90.000000-180.000000</p> <p>Integer The latitude/longitude is returned in integer format. For example: 90000000-180000000</p>
--------------	--

optionName	Description
Datum	<p>Determines the North American Datum to use when geocoding datum on the input value. Datum is the mathematical model of the Earth used to calculate the coordinates on any map, chart, or survey system.</p> <p>NAD27 This datum does not include the Alaskan Islands or Hawaii. Latitudes and longitudes that are surveyed in the NAD27 system are valid only in reference to NAD27 and are not valid for maps outside the U.S.</p> <p>NAD83 This datum is earth-centered and defined with satellite and terrestrial data. NAD83 is compatible with the World Geodetic System 1984 (WGS84), which is the terrestrial reference frame associated with the NAVSTAR Global Positioning System (GPS) used extensively for navigation and surveying. Default.</p>
CentroidPreference	<p>Determines the type of centroids returned by the geocoder. A centroid is the center of an area. The centroid coordinates are the average of the sets of coordinates that describe the area.</p> <p>NoCentroids Do not return centroids. If an address-level geocode cannot be determined, do not attempt to determine a centroid.</p> <p>AddressUnavailable Return a ZIP Code centroid if an address-level geocode cannot be determined (default).</p> <p>AllCentroids Return ZIP Code centroids only. If you select this option, address-level geocodes will not be returned.</p>

optionName	Description
FallbackToStreet	<p>Specifies whether to attempt to return a street centroid when an address-level geocode cannot be determined. To determine a street centroid, the geocoder searches the input ZIP Code or city for the closest match. If the geocoder is able to locate the street, it returns a geocode along the matched street segment.</p> <p>For example, if the input address is 5000 Walnut Street, Boulder 80301, and there is no 5000 Walnut Street, the geocoder searches for the closest match to that address within the ZIP Code 80301. If there were no input ZIP Code, the geocoder would search for the closest match to the input address within Boulder.</p> <p>If the input address is Walnut Street, Boulder 80301, since there is no house number, the geocoder searches for the street within the input ZIP Code.</p> <p>Street centroid geocodes are indicated by value in the LocationCode output field that begins with "C". For more information, see Street Centroid Location Codes on page 354.</p> <p>Note: This option is not available if you set <code>MatchMode</code> to CASS.</p> <p>Y Yes, attempt to determine the street centroid when an address-level geocode cannot be determined.</p> <p>N No, do not attempt to determine the street centroid when an address-level geocode cannot be determined. Default.</p>
FallbackToGeographic	<p>Specifies whether to attempt to return a city, county, or state centroid when an address-level geocode cannot be determined. The geocoder returns the most precise geographic centroid that it can based on the input. For example, if the input contains a valid city and state, a city centroid would be returned.</p> <p>Note: There are approximately 300 major cities that can be geocoded to a city centroid level even if a valid state is not provided in the input.</p> <p>Geographic centroid geocodes are indicated by value in the LocationCode output field that begins with "G". For more information, see Geographic Centroid Location Codes on page 360.</p> <p>Note: This option is not available if you set <code>MatchMode</code> to CASS.</p> <p>Y Yes, attempt to determine the geographic centroid when an address-level geocode cannot be determined.</p> <p>N No, do not attempt to determine the geographic centroid when an address-level geocode cannot be determined. Default.</p>

optionName	Description
------------	-------------

AddressPointInterpolation	<p>Specifies whether to perform address point interpolation when an exact match for the address cannot be found in the geocoding database. Address point interpolation is a patented process that results in a more accurate interpolated point. It improves upon regular street segment interpolation by using point data in the interpolation process, as opposed to using street segments alone.</p>
---------------------------	---

Note: Address point interpolation is only available when using a point-level geocoding database. It is not available when using point addresses in an auxiliary file.

- Y** Yes, perform address point interpolation.
- N** No, do not perform address point interpolation. Default.

The following illustration shows how address point interpolation works. In the example, the input house number is 71. The geocoding database contains address points for 67 and 77. The street segment has a range of 11 to 501. With address point interpolation, GeocodeUSAddress performs the interpolation for the input house number 71 using the points of 67 and 77. Without address point interpolation, GeocodeUSAddress performs the interpolation with the street segment end points of 11 and 501, resulting in a far less accurate result.

optionName	Description
------------	-------------

CenterlineOffset	<p>The offset distance, in feet, used to calculate the street centerline coordinates. Default = 0 feet.</p> <p>If you specify a value other than 0, GeocodeUSAAddress calculates the street centerline coordinates by offsetting the centerline point by the distance you specify in the direction of the parcel centroid.</p>
------------------	--

In an interpolated match, the centerline offset cannot be greater than the distance from the centerline to the interpolated address point. If you specify a centerline offset distance that is greater than this distance, the offset will be limited to the distance to the interpolated point. In effect, the centerline coordinates would be the same as the coordinates for the interpolated point.

RetrieveAPN	<p>Specifies whether to determine the address's APN (assessor's parcel number). The APN is an ID number assigned to a property by the local property tax authority. The APN is returned in the APN output field, which is part of the Census output group.</p>
-------------	---

Note: This option requires that you have licensed and installed the Cenrus Enhanced Points or Cenrus Premium Points database. APN data is not available for all addresses. See the coverage map included with the points database.

- Y** Yes, return the assessor's parcel number.
- N** No, do not return the assessor's parcel number. Default.

optionName	Description
RetrieveElevation	<p>Specifies whether to return the elevation of the address. Elevation is the distance above or below sea level of a given location. The elevation is returned in the Elevation output field, which is part of the Latitude/Longitude output group.</p> <p>Note: This option requires that you have licensed and installed the Centrus Premium Points database. Elevation data is not available for all addresses. See the coverage map included with the points database.</p> <p>Y Yes, return the elevation of the address.</p> <p>N No, do not return the elevation of the address. Default.</p>
AlwaysFindCandidates	<p>Specifies whether to enable centerline matching in order to get street centerline information.</p> <p>Note: Centerline matching requires that a point-level database is installed.</p> <p>Y Yes, enable centerline matching. To return centerline data in the output, you must also set <code>OutputRecordType = N</code>.</p> <p>N No, do not enable centerline matching. Default.</p>

optionName	Description
FIND_APPROXIMATE_PBKEY	<p>When FIND_APPROXIMATE_PBKEY is enabled, if an address match is not made to Master Location Data (MLD), but to a different dataset, the pbKey™ unique identifier of the nearest MLD point located within the search distance is returned. To distinguish when a fallback pbKey™ unique identifier is returned, the PBKey return value contains a leading character of "X" rather than "P", for example: X00001XSF1IF. Note, all of the other fields returned for the address match, including the geocode and all associated data, reflect the match results for the input address. The fallback pbKey™ unique identifier can then be used for the lookup to the GeoEnrichment dataset(s), and the attribute data for the fallback location is returned for the match.</p> <p>For more information, see PBKey Fallback.</p> <p>Note: This option requires that you have licensed and installed the Master Location Dataset.</p> <p>The search distance for the nearest MLD point is configurable using the SearchDistance parameter with an allowable search radius of 0-5280 feet and a default value of 150 feet.</p> <p>Y When a matched address does not have an associated pbKey™ unique identifier, attempt to return the nearest address record's pbKey™ unique identifier.</p> <p>N When a matched address does not have an associated pbKey™ unique identifier, do not return the nearest address record's pbKey™ unique identifier. Default.</p>
SearchDistance	<p>When the PBKey Fallback option is enabled, this field sets the distance to use when searching for the nearest address record with an associated pbKey™ unique identifier. The allowable range is 0-5280 feet. Default = 150 feet.</p> <p>Note: Supported only in forward geocoding.</p>

Matching Options

GeocodeUSAddress Matching Options

Matching options are used to determine how address searches are performed. They let you set match preferences, criteria and restrictions, and multiple match settings so that the matching can be as strict or relaxed as you need.

optionName	Description
AddressPreference	<p>Determines which address to use when more than one address is present in the address block.</p> <p>PreferPOBox Uses the P.O Box.</p> <p>PreferBottom Uses the second line entered. Default. You must select this value if you specify MatchMode=CASS.</p> <p>PreferStreetAddress Uses the street address.</p>
FirstLetterSearch	<p>Specifies whether to look for the correct first letter of a street name if the first letter is missing or incorrect. If enabled, the geocoder searches through the alphabet looking for the correct first letter to complete the street address.</p> <p>Note: This option is not available if the match mode is set to Exact.</p> <p>Y Perform first letter search.</p> <p>N Do not perform first letter search. Default.</p> <p>This example includes an incorrect first letter:</p> <p>Input: 4750 nalnut boulder co 80301 Output: 4750 Walnut St Boulder CO 80301-2532</p> <p>This example excludes a first letter:</p> <p>Input: 4750 alnut boulder co 80301 Output: 4750 Walnut St Boulder CO 80301-2532</p> <p>This example includes an extra first letter:</p> <p>Input: 4750 wwalnut boulder co 80301 Output: 4750 Walnut St Boulder CO 80301-2532</p>

optionName	Description
PerformDPV	<p>Specifies whether to process addresses using Delivery Point Validation (DPV). DPV is a United States Postal Service (USPS) technology that validates the accuracy of address information down to the physical delivery point. You must have licensed the optional DPV processing option to use this feature. You must also install the DPV database.</p> <p>To use DPV, enable this processing option and specify <code>D</code> in <code>OutputRecordType</code>.</p> <p>Y Perform DPV.</p> <p>N Do not perform DPV. Default.</p> <p>If you use DPV, multiple matches are automatically resolved.</p> <p>False-positive addresses, also known as seed records, are addresses the USPS monitors to ensure users are not attempting to create a mailing list from the DPV data. If the geocoder matches an address in your input data to a false-positive address, you receive a message indicating you have encountered a false-positive address. Processing continues to the end of your job, but DPV processing is not available for this job and subsequent jobs until you have reported the false-positive address encounter to technical support and have received a new security key.</p>
PerformLACSLink	<p>Specifies whether to process addresses using LACS^{Link}.</p> <p>Y Perform LACS^{Link}.</p> <p>N Do not perform LACS^{Link}. Default.</p> <p>If you use LACS^{Link}, be sure to choose to specify output record types P and Q so that the fields USLACS, USLACS.ReturnCode, and LACSADDRESS are included in the output.</p> <p>For more information, see Locatable Address Conversion System (LACS) on page 180.</p>

optionName	Description
PreferZipCodeOverCity	<p data-bbox="618 331 1430 394">Specifies whether to prefer candidates that match the input ZIP over candidates that match to input city.</p> <p data-bbox="703 407 1409 438">Note: This option is not available when processing in CASS mode.</p> <p data-bbox="618 485 1268 516">Y Prefer candidates that match the input ZIP Code.</p> <p data-bbox="618 533 1289 564">N Prefer candidates that match the input city. Default.</p> <p data-bbox="618 590 1057 621">For example, consider this input address:</p> <p data-bbox="618 638 927 695">301 BRYANT ST SAN FRANCISCO CA 94301</p> <p data-bbox="618 716 1409 779">Without this option enabled, the best match would be the one that matches the input city name:</p> <p data-bbox="618 795 992 852">301 BRYANT ST SAN FRANCISCO CA 94107-4167</p> <p data-bbox="618 873 1419 936">With this option enabled, the best match would be the one that matches the input ZIP Code:</p> <p data-bbox="618 953 922 1010">301 BRYANT ST PALO ALTO CA 94301-1408</p>

*Building, Firm name and Point of Interest matching**Firm name search*

optionName	Description
FirmNameSearch	<p>Specifies whether to use firm name matching logic to enhance address matching. Firm matching logic matches a business name in the input to recognized business names. The input firm name does not need to be spelled correctly to obtain a match. A soundex algorithm is used to match the firm name. A suite or unit number is not required to make the match.</p> <p>Note: This type of match is not available when processing in CASS mode.</p> <p>One of the following:</p> <p>Always Always attempt to match using firm name matching. If firm name matching fails, attempt to match using address matching.</p> <p>OnAddressLineFail Use firm matching only if a match cannot be determined using address matching.</p> <p>Never Do not use firm matching. Default. Note that the firm name may be corrected even if you specify Never if a match can be found using the address line data.</p>

Building search

optionName	Description
BuildingSearch	<p>Specifies whether to attempt to obtain a street address when the input address contains a building name with no suite or unit number.</p> <p>When this option is disabled, the geocoder is able to match to building names only if there is a unit number in the input. For example, if the building search option were disabled and you entered this input:</p> <p>5001 Chrysler Bldg New York, NY 10174</p> <p>The street address would be returned:</p> <p>405 Lexington Ave RM 5001 New York, NY 10174-5002</p> <p>With this option enabled, the geocoder is also able to obtain a street address when only a building name with no unit number is provided. For example, if you enable this option and provide this address:</p> <p>Chrysler Bldg New York, NY 10174</p> <p>You will get the street address:</p> <p>405 Lexington Ave New York, NY 10174-00</p> <p>Note: This type of match is not available when processing in CASS mode.</p> <p>Y Use firm name matching logic. Default.</p> <p>N Do not use firm name matching logic.</p>

Point of Interest matching

The optional Point Of Interest (POI) Index file (poi.gsi) included with the Master Location Data and HERE Point Addresses datasets provides expanded support in alias name matching.

To enable POI matching:

1. Add the MLD or HERE Point Addresses data as a Database Resource.
2. Set `BuildingSearch` to `Y`. The POI Index file will automatically be searched when this option is enabled and a firm, building or POI name is specified in the `AddressLine1` input field.
3. If an alias match is made to the POI Index file, the `IsAlias` output field, or, in the case of a centerline match, `CenterlineIsAlias` field, returns `A11`. To enable the return of these fields, set `OutputRecordType = Q` and `N` respectively.

Predictive Lastline

Predictive lastline allows you to match an address when only an input street address and latitude/longitude coordinates are provided, rather than the traditional street address with lastline input. For example, an input of 4750 Walnut with latitude/longitude coordinates located in Boulder, will return full address information.

Additional feature information

- Predictive Lastline uses a search radius of 150 feet.
- Predictive Lastline is disabled by default.
- When Predictive Lastline is not enabled, if a singleline address is provided, any input latitude and longitude values are ignored and the input address is geocoded.
- If the input latitude/longitude coordinates fall near the borders of multiple cities, the Enterprise Geocoding Module processes all cities and returns the results of the best match. If the results are determined as equal, then a multi-match is returned.
- Predictive lastline does not require a license for reverse geocoding.
- This feature will work with any type of dataset.

optionName	Description
PredictiveLastLine	Specifies whether GeocodeUSAddress should match using the street address and input latitude/longitude coordinates, rather than the traditional street address with lastline input.
	Y Enable Predictive Lastline processing.
	N Disable Predictive Lastline processing. Default.

Enabling Predictive Lastline

The following procedure describes how to enable and set up the Predictive Lastline feature.

1. **Set** PredictiveLastLine = Y
2. **Set** Latitude = integer value
3. **Set** Longitude = integer value
4. **Set** AddressLine1 = input street address

Search Area

The search area options set the search constraints to use when matching, such as to a city, finance area, or within a specified search radius distance that can be limited to the input state. The search area options can assist in finding a match when the input address contains limited or inaccurate city or ZIP Code information.

The following example illustrates the different match results for an input address that contains an incorrect ZIP Code when setting the Search Area to City, then to Finance Area.

Input Address	Match with Search Area set to City	Match with Search Area set to Finance Area
100 Main St East Aurora, NY 14166	100 MAIN ST EAST AURORA NY 14052-1633	100 MAIN ST DUNKIRK NY 14048-1844
<i>Input address has an incorrect ZIP Code.</i>	<i>Match is made to East Aurora 14052 as there is no candidate in the 14166 input ZIP Code.</i>	<i>Same finance area as the input ZIP Code 14166.</i>

Search Area and Distance Options

optionName	Description
------------	-------------

FIND_SEARCH_AREA	
------------------	--

optionName	Description
<p>Note: In CASS match mode, only the search area options described in <code>FIND_SEARCH_AREA_DEFAULT</code> are available.</p>	
FIND_SEARCH_AREA_DEFAULT	<p>The impact of the <code>FIND_SEARCH_AREA_DEFAULT</code> setting depends on the match mode you're using for matching.</p> <p>When <code>FIND_SEARCH_AREA_DEFAULT</code> is set and you're matching using either CASS or Relaxed match mode, the search area is determined based on the <code>CentroidPreference</code> setting:</p> <ul style="list-style-type: none"> • If <code>CentroidPreference = AllCentroids</code>, the <code>FIND_SEARCH_AREA_CITY</code> search area is used. • If <code>CentroidPreference</code> is set to either <code>NoCentroids</code> or <code>AddressUnavailable</code>, the <code>FIND_SEARCH_AREA_FINANCE</code> search area is used. <p>When <code>FIND_SEARCH_AREA_DEFAULT</code> is set and you're matching using any other match mode - Custom, Exact, Close or Interactive - the <code>FIND_SEARCH_AREA_FINANCE</code> search area is used.</p>
FIND_SEARCH_AREA_FINANCE	<p>Searches the entire Finance Area for possible streets.</p> <p>Note: This option has no effect when performing a ZIP centroid match or a geographic geocode.</p>
FIND_SEARCH_AREA_CITY	Searches the specified city.
FIND_SEARCH_AREA_EXPANDED	Enables the setting of the search radius distance to use when matching. See <code>FIND_SEARCH_AREA_DISTANCE</code> below.
FIND_EXPND_SRCH_LIM_TO_STATE	Limits the search to the state, within the search radius distance. The default search radius is 25 miles.

optionName	Description
FIND_SEARCH_AREA_DISTANCE	<p>When the FIND_SEARCH_AREA_EXPANDED option is selected, this field allows you to enter the search radius distance to use when matching. Valid values = 0-99 (miles). Default = 25 miles.</p> <p>Note: Ignored in CASS match mode.</p>

Multi-matches/Candidates

optionName	Description
KeepMultimatch	<p>Select this option to return the list of possible matches when there is more than one possible match for the input address and a single best match cannot be identified.</p> <p>Y Return the addresses that are possible matches for the input address. Default.</p> <p>N Do not return the ambiguous matches.</p>
KeepCandidates	<p>Select this option to return candidate addresses whenever the match attempt produces candidates. If you enable this option, the geocoder will return candidates both when the input address matches to a single address and when the input address matches multiple addresses.</p> <p>This option differs from <code>KeepMultimatch</code> in that the <code>KeepMultimatch</code> option does not return candidates if the input address matches to a single address.</p> <p>Y Return candidates for all match attempts.</p> <p>N Do not return candidates for all matches. Default.</p>
CloseMatchesOnly	<p>If you specify <code>KeepCandidates=Y</code> you can choose to return just those candidates that are considered to be a close match. The criteria used to determine whether a candidate is a close match are those you specify in the <code>MatchMode</code> option.</p> <p>Y Return close match candidates only. Default.</p> <p>N Return all candidates.</p>

Match Modes

Match modes determine the leniency used to make a match between your input and the Centrus data. Select a match mode based on the quality of your input and your desired output. For example,

if you have an input database that is prone to errors, you may want to select the relaxed match mode.

optionName	Description
MatchMode	Custom Allows you to select the specific criteria to use when matching the input address to an address in the postal database.
	Exact Requires a very tight match. This is a restrictive mode that generates the fewest number of match candidates to search, which decreases the time to obtain a match. When using this mode, ensure that your input address list is very clean; free of misspellings and incomplete addresses.
	Close Requires a moderately confident match. Generates a moderate number of match candidates.
	Relax This is the loosest match mode and generates the most match candidates, which increases the processing time and results in more multiple matches. Use this mode if your address list may contain misspellings and incomplete addresses. This mode does not respect the street parity for an address match. Default.
	Interactive Available in single-line address matching only. This mode is designed to better handle the specific matching challenges presented by interactive matching. Interactive mode permits for more flexible matching patterns and may, in some cases, return additional possible matches than relaxed match mode. This mode recognizes and parses two unit numbers on the same address line, for example a building and unit number. This mode does not respect the range parity when making an address match.
	CASS Imposes additional rules to ensure compliance with the USPS regulations for CASS. The purpose of this mode is to create a list of mailable addresses. This mode generates a large number of match candidates. This mode deviates from the other modes in its processing. This mode does not perform intersection, building name, or spatial alias (TIGER and TomTom street name alias) matches. It does not match to candidates from data sources that do not have USPS equivalent records. This mode recognizes and parses two unit numbers on the same address line, for example a building and unit number.

Interactive match mode

Interactive mode is designed for interactive mobile/web applications. In this use case, it is expected that users may enter single-line addresses that contain misspelled, inaccurate, and/or missing information, so this input is processed utilizing a looser set of criteria for matching than the other match modes. As a result, the matching output could include multiple match candidates. The list of matches would be presented to the user who could then select the desired match candidate. If an exact match is found, then that single match candidate is returned; a mix of accurate and inaccurate results are not presented.

Capabilities and restrictions:

- Interactive match mode allows users to break the cardinal rule: If the user enters 123 S Main and there is only 123 N Main, a match is made and a match code is returned that reflects the modified directional.
- Interactive match mode handles cases where users transpose pre-directionals with post-directionals without penalty.
- Interactive match mode ignores the 'Prefer ZIP Code over city' setting. When the city and ZIP Code don't match correctly, the best geocoding result will be returned based on an analysis of all the input address elements.
- When operating in interactive mode, in cases where a point address or interpolated street address result cannot be determined, ZIP-9 or ZIP-7 centroid(s) may be returned.

The following table shows a comparison of the match results when running in interactive vs. close or relaxed modes.

Single-line input address	Interactive mode match candidates	Close/Relaxed mode single match candidate
HIGHLAND VIEW WINCHESTER 01890	5 HIGHLAND VIEW AVE, WINCHESTER, MA 01890 5 HIGHLAND TER, WINCHESTER, MA 01890 5 HIGHLAND AVE, WINCHESTER, MA 01890	5 HIGHLAND VIEW AVE, WINCHESTER, MA 01890
414 PINE WILLIAMSFIELD 61489	414 N PINE ST, WILLIAMSFIELD, IL 61849 414 PINE ST, WILLIAMSFIELD, IL 61489	414 N PINE ST, WILLIAMSFIELD, IL 61849
46 HORNBEAM ST CRANSTON RI (conflict with street type)	46 HORNBEAM DR, CRANSTON, RI	46 HORNBEAM ST, CRANSTON, RI
611 W 13TH JOPLIN MO 64801 (conflict between directional and ZIP Code)	611 E 13TH ST, JOPLIN, MO 64801 611 W 13TH ST, JOPLIN, MO 64804	611 W 13TH ST, JOPLIN, MO 64804

Match Code

Extended Match Codes

The Extended Match Codes option enables the return of additional information about any changes in the house number, unit number and unit type fields. In addition, it can indicate whether there was address information that was ignored. The Extended Match Code is only returned for address-level matches (match codes that begin with A, G, H, J, Q, R, S, T or U), in which case a 3rd hex digit is appended to the match code (see [Match Codes](#) on page 338).

Note: A typical match code contains up to 4 characters: a beginning alpha character followed by 2 or 3 hex digits. The third hex digit is only populated for intersection matches or as part of the Extended Match Code.

For information about the 3rd hex digit values for:

- Intersection matches, see [Definitions for 1st-3rd hex digit match code values](#) on page 340
- Extended Match Codes, see [Definitions for Extended Match Code \(3rd hex digit values\)](#) on page 341

"Address information ignored" is specified when any of these conditions apply:

- The output address has content in the `AdditionalInputData` field.
- The output address has a second address line (`AddressLine2`).
- The input address is a dual address (two complete addresses in the input address). For example, "4750 Walnut St. P.O Box 50".
- The input last line has extra information that is not a city, state or ZIP Code, and is ignored. For example, "Boulder, CO 80301 USA", where "USA" is ignored when matching.

The table below provides descriptions of the Extended Match Code 3rd hex digit return values.

Input Addressline	Output Addressline	Extended Code	Description
4750 WALNUT ST STE 200	4750 WALNUT ST STE 200	0	Matched on all address information on line, including Unit Number and Unit Type if included.
4750 WALNUT ST C/O JOE SMITH	4750 WALNUT ST	1	Matched on Unit Number and Unit Type if included. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> or <code>AdditionalInputData</code> field.
4750 WALNUT ST UNIT 200	4750 WALNUT ST STE 200	2	Matched on Unit Number. Unit Type changed.

Input Addressline	Output Addressline	Extended Code	Description
4750 WALNUT ST UNIT 200 C/O JOE SMITH	4750 WALNUT ST STE 200	3	Matched on Unit Number. Unit Type changed. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
4750 WALNUT ST STE 2-00	4750 WALNUT ST STE 200	4	Unit Number changed or ignored.
4750 WALNUT ST STE 2-00 C/O JOE SMITH	4750 WALNUT ST STE 200	5	Unit Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
4750 WALNUT ST STE 400	4750 WALNUT ST STE 400	6	Unit Number changed or ignored. Unit Type changed or ignored. In this example, Suite 400 is not valid for the input address, but the address match is not prevented because of an invalid unit number.
4750 WALNUT ST UNIT 2-00 C/O JOE SMITH	4750 WALNUT ST STE 200	7	Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
47-50 WALNUT ST STE 200	4750 WALNUT ST STE 200	8	Matched on Unit Number and Unit Type if included. House number changed or ignored.
47-50 WALNUT ST STE 200 C/O JOE SMITH	4750 WALNUT ST STE 200	9	Matched on Unit Number and Unit Type if included. House number changed or ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
47-50 WALNUT ST UNIT 200	4750 WALNUT ST STE 200	A	Matched on Unit Number. Unit Type changed. House Number changed or ignored.
47-50 WALNUT ST UNIT 200 C/O JOE SMITH	4750 WALNUT ST STE 200	B	Matched on Unit Number. Unit Type changed. House Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
47-50 WALNUT ST STE 20-0	4750 WALNUT ST STE 200	C	House Number changed or ignored. Unit Number changed or ignored.

Input Addressline	Output Addressline	Extended Code	Description
47-50 WALNUT ST STE 20-0 C/O JOE SMITH	4750 WALNUT ST STE 200	D	House Number changed or ignored. Unit Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> or <code>AdditionalInputData</code> field.
47-50 WALNUT ST UNIT 20-0	4750 WALNUT ST STE 200	E	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored.
47-50 WALNUT ST UNIT 2-00 C/O JOE SMITH	4750 WALNUT ST STE 200	F	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> or <code>AdditionalInputData</code> field.

Match Code Option

optionName	Description
ExtendedMatchCode	Specifies whether to return the Extended Match Code. For more information, see Match Code on page 231.
Y	Yes, return the Extended Match Code.
N	No, do not return the Extended Match Code. Default.

Custom Match Criteria

Difference Between Match Criteria for U.S. and Non-U.S. Geocoding

The "must match criteria" used in the custom match mode of Geocode US Address work differently than the "close match criteria" in non-U.S. geocoders. For Geocode US Address, the custom match criteria specify which address elements must match the reference database in order for the match to be returned as a candidate. All candidates returned by Geocode US Address will match the elements you specify as long as those elements are available in the reference database. However, in non-U.S. geocoders, the "close match" criteria are used to determine which candidates are close matches and which are non-close matches. Non U.S. geocoders can return both close candidates and non-close candidates, depending on whether you enable the `CloseMatchesOnly` option. In summary, the "must match" criteria used by Geocode US Address automatically limit the candidates returned, whereas the "close match criteria" used by non-U.S. geocoders do not limit the candidates returned.

Custom Match Criteria Options

optionName	Description
MustMatchInput	<p>Specifies whether candidates must match all non-blank input fields. For example, if an input address contains a city and postal code, then candidates for this address must match the city and postal code.</p> <p>Y Yes, candidates must match all input.</p> <p>N No, candidates do not have to match all input. Default.</p>
MustMatchStreet	<p>Specifies whether candidates must match the street name.</p> <p>Y Yes, candidates must match the street name.</p> <p>N No, candidates do not have to match the street name. Default.</p>
MustMatchStateProvince	<p>Specifies whether candidates must match the state.</p> <p>Y Yes, candidates must match the state.</p> <p>N No, candidates do not have to match the state. Default.</p>

optionName	Description
MustMatchHouseNumber	<p>Specifies whether candidates must match the house number. If the input house number is not within a range from the street, GeocodeUSAddress selects the nearest range on the street which has the same parity (even or odd house number) as the input address number. GeocodeUSAddress returns one or more of the closest matches inside this range that preserves street parity. This requires GeocodeUSAddress to change the house number. The new house number is equal to one of the range's endpoints, possibly plus or minus one to preserve street parity.</p> <p>Note: Even when this option is disabled and an inexact match on the house number is found, GeocodeUSAddress still returns an error code.</p> <p>When this option is disabled and no exact matching house number is found, a match code of either E029 (no matching range, single street segment found), or E030 (no matching range, multiple street segment) is returned.</p> <p>GeocodeUSAddress does not change the house number on the output address. In order to access the inexact address number candidates, you must specify <code>KeepMultimatch=Y</code>. If there are inexact house number candidates returned, the corresponding match codes begin with the letter 'H' indicating that the house number was not matched.</p> <p>Additionally, even when one or more exact candidates are found, inexact matches to the house number are still on the list of possible candidates, and these can be differentiated from the others by their Hxx match codes. For more information about match codes, see Match Codes on page 338.</p> <p>One of the following:</p> <p>Y Yes, candidates must match the house number. Default.</p> <p>N No, candidates do not have to match the house number.</p>
MustMatchCity	<p>Specifies whether candidates must match the city. If you do not require exact matches on city, the geocoder searches on the street address matched to the particular postal code, and considers other cities that do not match the name, but do match the postal code.</p> <p>Y Yes, candidates must match the city.</p> <p>N No, candidates do not have to match the city. Default.</p>
MustMatchPostalCode	<p>Specifies whether candidates must match the postal code. If you do not require exact match on postal codes, the geocoder searches a wider area for a match. While this results in slower performance, the match rate is higher because the request does not need to match exactly when it compares match candidates.</p> <p>Y Yes, candidates must match the postal code.</p> <p>N No, candidates do not have to match the postal code. Default.</p>

Output Format

GeocodeUSAddress Output Format Options

The following table lists the GeocodeUSAddress options that control the format of the output.

optionName	Description
OutputCasing	<p>Specifies the casing of the output data. One of the following:</p> <p>M Returns the output in mixed case. Default. For example: 123 Main St Mytown FL 12345</p> <p>U Returns the output in upper case. For example: 123 MAIN ST MYTOWN FL 12345</p>
OutputFormattedOnFail	<p>Specifies whether to normalize addresses that fail to match, and addresses that are unchanged. Normalization formats an address to the USPS guidelines without validating the address.</p> <p>Y Perform standardization. Default.</p> <p>N Do not perform standardization.</p>
OutputPostalCodeSeparator	<p>Specifies whether to include the dash in full postal code output.</p> <p>Y Include the dash. Default.</p> <p>N Do not include the dash.</p>
OutputVerbose	<p>Specifies whether to provide an additional description field as output. These fields provide the text equivalent to a field represented by a code. For example, LocationCode returns a code that indicates the accuracy (quality) of the assigned geocode. LocationCode.Description provides the description for the code returned.</p> <p>Y Include verbose fields.</p> <p>N Do not include verbose fields. Default.</p>

Output Data

GeocodeUSAddress Output Data Options

The following table shows the GeocodeUSAddress options that control which data GeocodeUSAddress returns in the output.

optionName	Description
OutputRecordType	<p>Specifies optional data to include in the output. Note that GeocodeUSAddress always returns the default data listed in Default Output on page 247. The data you select here is returned with the default output data.</p> <ul style="list-style-type: none"> • X—Auxiliary • B—Block Address • C—Census • N—Centerline Projection • D—DPV • Z—Geo Confidence • L—Latitude/Longitude • E—Parsed Elements • P—Postal Data • Q—Qualifiers • R—Range • S—Segment <p>For a description of the fields in each output group, see Output on page 237.</p> <p>If you do not want all of the fields in a record type returned, do not use <code>OutputRecordType</code>; instead, use <code>OutputFields</code> to specify the desired individual output fields.</p>
OutputFields	<p>Specifies the individual output fields you want returned. List fields with a pipe () between each field. You can use this option instead of the <code>OutputRecordType</code> option to limit the output to those fields that are important to your data needs.</p> <p>By default, these are the address fields returned: <code>AddressLine1 LastLine Longitude Latitude MatchCode LocationCode</code></p> <p>For a list of all the fields included in each data field, see Output on page 237.</p>

Output

GeocodeUSAddress always returns a default set of output fields that contain the latitude/longitude, standardized address, and result indicators. For information about these fields, see [Default Output](#) on page 247. You can also choose to include optional categories of output data.

Auxiliary

Auxiliary data output fields contain information about the an auxiliary file match. For more information about using an auxiliary file, see [Auxiliary File Overview](#) on page 331. GeocodeUSAddress only returns values when matching against an auxiliary file. To include auxiliary data fields in the output, set `OutputRecordType = X`.

columnName	Max. Field Length with null terminator	Description
AuxiliaryData	301	The user data field in an auxiliary file match. Note: GeocodeUSAddress does not process this information. It simply includes the user data contained in the auxiliary file.
MCDCode	6	The Minor Civil Division (MCD) code. A Minor Civil Division is a subdivision of a county, such as a township. There are Minor Civil Divisions in 28 states, the District of Columbia, Puerto Rico, and Island Areas. Minor Civil Divisions are defined by U.S. Census Bureau.
MCDName	41	The Minor Civil Division (MCD) name. A Minor Civil Division is a subdivision of a county, such as a township. There are Minor Civil Divisions in 28 states, the District of Columbia, Puerto Rico, and Island Areas. Minor Civil Divisions are defined by U.S. Census Bureau.

Block Address

The BlockLine<1-6> output fields are populated with the input AddressLine<1-6> fields when a match is not made and **Block Address** output data is enabled.

To include block data in the output, set `OutputRecordType = B`.

If there are any empty lines in the input fields AddressLine1 through AddressLine6, GeocodeUSAddress moves the output lines to the first empty BlockLine output field, eliminating the blank lines.

columnName	Max. Field Length with null terminator	Description
BlockLine<1-6>	104	When a match is not made, the BlockLine<1-6> output fields are populated with the input AddressLine<1-6> fields. Each BlockLine output field has a maximum field length with null terminator of 104.

Census

Census output fields contain U.S. Census information about the address. To include census data in the output, set `OutputRecordType = C`.

Note: The following Census output fields - `CBSADivisionName`, `CBSAName`, `CSAName` and `USCountyName` - are only returned when you set the option `OutputVerbose=Y`.

columnName	Max. Field Length with null terminator	Description
APN	46	The assessor's parcel number of the property. The assessor's parcel number is an ID number assigned to a property by the local property tax authority.
BlockSuffix	2	The block suffix for the Census block in which the address is located. A block suffix is a single character assigned to subsections of U.S. Census blocks that are split by a higher-level boundary, such as a municipal boundary. A block suffix is either "A" or "B". For information about U.S. Census block suffixes, see the <i>Geographic Areas Reference Manual</i> , available at the U.S. Census Bureau website: www.census.gov/geo/www/garm.html Block suffixes are only available if you are using Centrus Enhanced data.

columnName	Max. Field Length with null terminator	Description
CBSACode	6	<p>The code for the Core Based Statistical Area (CBSA) in which the address is located.</p> <p>A CBSA is a collective term that refers to both metropolitan and micropolitan areas. A metropolitan area has a population of more than 50,000, and a micropolitan area has a population between 10,000 and 49,999. For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website:</p> <p>www.census.gov/population/www/metroareas/metroarea.html</p>
CBSADivisionCode	6	<p>The code of the Core Based Statistical Area (CBSA) division in which the address is located.</p> <p>A CBSA division is a metropolitan statistical area with a population of at least 2.5 million that has been subdivided to form smaller groupings of counties referred to as "metropolitan divisions." For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website:</p> <p>www.census.gov/population/www/metroareas/metroarea.html</p>
CBSADivisionName	128	<p>The name of the Core Based Statistical Area (CBSA) division in which the address is located.</p> <p>A CBSA division is a metropolitan statistical area with a population of at least 2.5 million that has been subdivided to form smaller groupings of counties referred to as "metropolitan divisions." For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website:</p> <p>www.census.gov/population/www/metroareas/metroarea.html</p> <p>Note: The CBSA division name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>

columnName	Max. Field Length with null terminator	Description
CBSAMetro	2	<p>Indicates whether the core based statistical area (CBSA) in which the address is located is a metropolitan area or a micropolitan area. One of the following:</p> <p>Y Yes, the address is located in a metropolitan statistical area. Metropolitan areas have a population greater than 50,000.</p> <p>N No, the address is not located in a metropolitan area. It is located in a micropolitan area. Micropolitan areas have a population between 10,000 and 49,999.</p> <p>null There is no data available to determine whether the address is in a metropolitan or micropolitan area.</p> <p>A CBSA is a collective term that refers to both metropolitan and micropolitan areas. A metropolitan area has a population of more than 50,000, and a micropolitan area has a population between 10,000 and 49,999. For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website: www.census.gov/population/www/metroareas/metroarea.html</p>
CBSAName	128	<p>The name of the core based statistical area (CBSA) in which the address is located.</p> <p>A CBSA is a collective term that refers to both metropolitan and micropolitan areas. A metropolitan area has a population of more than 50,000, and a micropolitan area has a population between 10,000 and 49,999. For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website: www.census.gov/population/www/metroareas/metroarea.html</p> <p>Note: The CBSA name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>

columnName	Max. Field Length with null terminator	Description
CensusBlockID	16	<p>The 15-digit identification number of the census block in which the address is located. Census blocks are the smallest geographic area for which the Bureau of the Census collects and tabulates decennial census data. Census blocks are formed by streets, roads, railroads, streams and other bodies of water, other visible physical and cultural features, and the legal boundaries shown on Census Bureau maps. For more information about U.S. Census blocks, see the <i>Geographic Areas Reference Manual</i>, available at the U.S. Census Bureau website: www.census.gov/geo/www/garm.html</p> <p>The Census block ID is in the format:</p> <pre>sscccttttttgbbb</pre> <p>Where:</p> <ul style="list-style-type: none"> ss The two-digit state FIPS code. ccc The three-digit county FIPS code. ttttt The six-digit Census tract FIPS code. g The single-digit block group FIPS code. bbb The block FIPS code. <p>Note: The value in the CensusBlockID field does not contain a period for the Census tract FIPS code. This may deviate from the industry standard.</p>
CensusTract	7	<p>The six-digit ID of the Census tract in which the address is located. Census tracts are small, relatively permanent geographic entities within counties (or the statistical equivalents of counties). Generally, census tracts have between 2,500 and 8,000 residents and boundaries that follow visible features. For more information about U.S. Census tracts, see the <i>Geographic Areas Reference Manual</i>, available at the U.S. Census Bureau website: www.census.gov/geo/www/garm.html</p>
CSACode	4	<p>Denotes the code for a geographic entity that consists of 2 or more adjacent CBSAs with employment interchange measures of at least 15.</p>

columnName	Max. Field Length with null terminator	Description
CSAName	128	<p>The name of the combined statistical area (CSA) in which the address is located.</p> <p>A CSA is a combination of two or more adjacent Core Based Statistical Areas (CBSAs) with a high employment interchange measure. The employment interchange measure is the sum of the percentage of employed residents of the smaller entity who work in the larger entity and the percentage of the employment in the smaller entity that is accounted for by workers who reside in the larger entity. Pairs of CBSAs with employment interchange measures of at least 25% combine automatically. Pairs of CBSAs with employment interchange measures of at least 15%, but less than 25%, may combine if local opinion in both areas favors combination.</p> <p>Note: The CSA name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
USCountyName	128	<p>The name of the county or parish in which the address is located.</p> <p>Note: The county/parish name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
USFIPSCountyNumber	4	The three-digit FIPS county code of the county in which the address is located.
USFIPSStateCode	3	The two-digit FIPS state code of the state in which the address is located.
USFIPSStateCountyCode	6	The five-digit FIPS code for the state and county in which the address is located.

Centerline

Centerline Output Fields

Centerline output fields contain information specific to a centerline match. For more information about setting up centerline matching, refer to [Geocoding Options](#) on page 210. To include centerline fields in the output, set `OutputRecordType = N`.

columnName	Max. Field Length with null terminator	Description
CenterlineBearing	6	The compass direction, in decimal degrees, from the point data match to the street centerline match. The compass direction is measured clockwise from 0 degrees north. For example, if the centerline match is directly north of the point match, the centerline bearing would be 0.
CenterlineBlockLeft	16	The Census FIPS Code that indicates the address is on the left side of the street.
CenterlineBlockRight	16	The Census FIPS Code that indicates the address is on the right side of the street.
CenterlineBlockSuffixLeft	2	<p>The block suffix of the block on the left side of the street.</p> <p>A block suffix is a single character assigned to subsections of U.S. Census blocks that are split by a higher-level boundary, such as a municipal boundary. A block suffix is either "A" or "B". For information about U.S. Census block suffixes, see the <i>Geographic Areas Reference Manual</i>, available at the U.S. Census Bureau website:</p> <p>www.census.gov/geo/www/garm.html</p> <p>Block suffixes are only available if you are using Centrus Enhanced data.</p>
CenterlineBlockSuffixRight	2	<p>The block suffix of the block on the right side of the street.</p> <p>A block suffix is a single character assigned to subsections of U.S. Census blocks that are split by a higher-level boundary, such as a municipal boundary. A block suffix is either "A" or "B". For information about U.S. Census block suffixes, see the <i>Geographic Areas Reference Manual</i>, available at the U.S. Census Bureau website:</p> <p>www.census.gov/geo/www/garm.html</p> <p>Block suffixes are only available if you are using Centrus Enhanced data.</p>

columnName	Max. Field Length with null terminator	Description																				
CenterlineDataCode	3	<p>Indicates the data used to obtain a centerline match for the address. One of the following:</p> <table border="0"> <tr> <td>0</td> <td>USPS data.</td> </tr> <tr> <td>1</td> <td>TIGER data.</td> </tr> <tr> <td>2</td> <td>TomTom data.</td> </tr> <tr> <td>6</td> <td>HERE data.</td> </tr> <tr> <td>7</td> <td>TomTom point-level data.</td> </tr> <tr> <td>8</td> <td>Centrus point-level data.</td> </tr> <tr> <td>9</td> <td>Auxiliary file data.</td> </tr> <tr> <td>10</td> <td>User Dictionary.</td> </tr> <tr> <td>11</td> <td>HERE point-level data.</td> </tr> <tr> <td>12</td> <td>Master Location data.</td> </tr> </table> <p>For more information about these databases, see Enterprise Geocoding Databases on page 173</p>	0	USPS data.	1	TIGER data.	2	TomTom data.	6	HERE data.	7	TomTom point-level data.	8	Centrus point-level data.	9	Auxiliary file data.	10	User Dictionary.	11	HERE point-level data.	12	Master Location data.
0	USPS data.																					
1	TIGER data.																					
2	TomTom data.																					
6	HERE data.																					
7	TomTom point-level data.																					
8	Centrus point-level data.																					
9	Auxiliary file data.																					
10	User Dictionary.																					
11	HERE point-level data.																					
12	Master Location data.																					
CenterlineDirection	2	<p>Indicates the order of numbers on a segment for a centerline match.</p> <table border="0"> <tr> <td>F</td> <td>Forward</td> </tr> <tr> <td>R</td> <td>Reversed</td> </tr> <tr> <td>B</td> <td>Both</td> </tr> <tr> <td>U</td> <td>Undetermined</td> </tr> </table>	F	Forward	R	Reversed	B	Both	U	Undetermined												
F	Forward																					
R	Reversed																					
B	Both																					
U	Undetermined																					
CenterlineDistance	8	Distance, in feet, from the point-level match to the centerline match.																				
CenterlineHouseNumberHigh	12	The highest address number in the range of addresses on the street segment. For example, if the address range for the street segment is 1000 to 2000, the CenterlineHouseNumberHigh would be 2000.																				
CenterlineHouseNumberLow	12	The lowest address number in the range of addresses on the street segment. For example, if the address range for the street segment is 1000 to 2000, the CenterlineHouseNumberLow would be 1000.																				

columnName	Max. Field Length with null terminator	Description
CenterlineIsAlias	4	<p>Three characters indicating that GeocodeUSAddress located a centerline match by an index alias. The first is an N for normal street match or A for alias match (including buildings, aliases, firms, etc.). The next two characters are:</p> <p>01 Basic index (normal address match)</p> <p>02 USPS street name alias index</p> <p>03 USPS building index</p> <p>04 USPS firm name index</p> <p>05 Statewide intersection alias match (when using the <code>Usw.gsi</code> or <code>Use.gsi</code> file)</p> <p>06 Spatial data street name alias (when using, the <code>Us_pw.gsi</code>, <code>Us_pe.gsi</code>, <code>Us_psw.gsi</code>, or <code>Us_pse.gsi</code> file is required)</p> <p>07 Alternate index (when using <code>Zip9.gsu</code>, <code>Zip9e.gsu</code>, and <code>Zip9w.gsu</code>)</p> <p>08 LACS^{Link}</p> <p>09 Auxiliary file match</p> <p>10 Centrus Alias index (when using <code>usca.gsi</code>)</p> <p>11 POI index (when using <code>poi.gsi</code>)</p> <p>12 USPS Preferred Alias</p> <p>13 ZIPMove match (when using <code>us.gsz</code>)</p> <p>14 Expanded Centroids match (when using <code>us_cent.gsc</code> and/or <code>bldgcent.gsc</code>)</p>
CenterlineLatitude	11	A 7-digit number in degrees and calculated to 4 decimal places for a centerline match. This field is only returned if <code>AlwaysFindCandidates=Y</code>
CenterlineLeadingDirectional	3	The street directional that precedes the street name for a centerline match. For example, the N in 138 N Main Street.
CenterlineLongitude	12	A 7-digit number in degrees and calculated to 4 decimal places (in the format specified) for a centerline match. This field is only returned if <code>AlwaysFindCandidates=Y</code>

columnName	Max. Field Length with null terminator	Description
CenterlineParity	2	Indicates which side of the street has odd numbers for a centerline match. L The left side of the street has odd numbers. R The right side of the street has odd numbers. B Both sides of the street have odd numbers. U Undetermined.
CenterlineRoadClass	3	The type of road for a centerline match: 1 Major 2 Minor
CenterlineSegmentCode	11	The unique 10-digit street segment ID assigned by the street network data provider.
CenterlineStreetName	41	The name of the street.
CenterlineStreetSuffix	5	The street type of the matched centerline location. For example, AVE in "Washington AVE".
CenterlineTrailingDirectional	3	The street directional that follows the street name. For example, the N in 456 Washington AVE N.

Default Output

Default Output Fields

The geocoder always returns fields that contain the latitude/longitude, standardized address, and result indicators. Result indicators describe how well the geocoder matched the input address to a known address and assigned a location. Result indicators also describe the overall status of a match attempt.

columnName	Max. Field Length with null terminator	Description
AdditionalInputData	61	This field may contain input data that was not used for matching; for example, input address information that appears after a mail stop or attention designator.
AddressLine1	104	The first line of the address. For example: 1 Global View Troy, NY 12180-8371
AddressLine2	104	The second line of the address. For example: 4200 Parliament PI STE 600 Lanham, MD 20706-1882
City	29	The municipality name.

columnName	Max. Field Length with null terminator	Description
Confidence	4	<p>Indicates the confidence in the output provided, from 0 to 100. The higher the score, the higher the probability that the match is correct. If the match is exact, the confidence score is 100. For all other matches, the confidence score is calculated based on which portions of the input address had to be changed to obtain a match. Specifically, the confidence score is calculated by subtracting values from 100 as follows:</p> <ul style="list-style-type: none"> • If the state is changed to obtain a match: <ul style="list-style-type: none"> • Added the state -3.75 • No state -7.5 • If the city is changed to obtain a match: <ul style="list-style-type: none"> • Added city -2.5 • No city -5.0 • If the house number is changed to obtain a match: <ul style="list-style-type: none"> • Added house number -3.75 • No house number -7.5 • If the street name is changed to obtain a match: <ul style="list-style-type: none"> • Added street name -3.75 • No street name -7.5 • If the trailing directional is changed to obtain a match: <ul style="list-style-type: none"> • Added trailing directional -1.25 • No trailing directional -2.5 • If the leading directional is changed to obtain a match: <ul style="list-style-type: none"> • Added leading directional -1.25 • No leading directional -2.5 • If the street suffix is changed to obtain a match: <ul style="list-style-type: none"> • Added street suffix -1.25 • No street suffix -2.5 • If the postal code is changed to obtain a match: -11.25 <p>If you have enabled the option to return centroids, the confidence value indicates the type of centroid returned:</p> <ul style="list-style-type: none"> • 60 for a street centroid • 50 for a postal code centroid • 35 for a city centroid • 30 for a county centroid • 25 for a state centroid

columnName	Max. Field Length with null terminator	Description
Country	25	The name of the country. This field always contains United States of America .
FirmName	41	The name of the business if the address is a business address.
LastLine	61	The complete last address line (city, state, and postal code).
Latitude	11	Seven-digit number in degrees and calculated to four decimal places (in the format specified).
LocationCode	5	A value indicating the accuracy (quality) of the assigned geocode. For more information, see Address Location Codes on page 346.
Longitude	12	Seven-digit number in degrees and calculated to four decimal places (in the format specified).
MatchCode	5	Indicates the portions of the address that matched to the geocoding directory file. For more information, see Match Codes on page 338.
PBKey	13	A unique address identifier that is returned when an address match is made using the Master Location Dataset. The pbKey™ unique identifier is used as a lookup key to a GeoEnrichment dataset, in order to return attribute data for the match.
PostalCode	10	Nine-digit ZIP Code with or without a hyphen.
PostalCode.AddOn	5	Four-digit ZIP Code extension.
PostalCode.Base	6	Five-digit ZIP Code.

columnName	Max. Field Length with null terminator	Description
ProcessedBy	4	The underlying software that processed the request. EnterpriseGeocoding for GeocodeUSAddress.
StateProvince	3	Two-character state abbreviation.
Status	2	Reports the success or failure of the match attempt null Success F Failure
Status.Code	23	If GeocodeUSAddress could not process the address, this field will show the reason. <ul style="list-style-type: none"> • Internal System Error • No Geocode Found • Insufficient Input Data
Status.Description	128	If GeocodeUSAddress could not process the address, this field will show a description of the failure. Problem + explanation Returned when Status.Code = Internal System Error. Geocoding Failed Returned when Status.code = No Geocode Found. No location returned Returned when Status.code = No Geocode Found.

columnName	Max. Field Length with null terminator	Description																						
StreetDataType	20	<p>The data set used to geocode the address.</p> <table border="0"> <tr> <td>USPS</td> <td>USPS</td> </tr> <tr> <td>TIGER</td> <td>TIGER</td> </tr> <tr> <td>TOMTOM</td> <td>TomTom Streets data set</td> </tr> <tr> <td>SANBORN POINT DATA</td> <td>Sanborn Points data set</td> </tr> <tr> <td>NAVTEQ</td> <td>NAVTEQ/HERE Streets data set</td> </tr> <tr> <td>TOMTOM POINT DATA</td> <td>TomTom Points data set</td> </tr> <tr> <td>AUXILIARY</td> <td>Auxiliary file</td> </tr> <tr> <td>CENTRUS POINT DATA</td> <td>Centrus Points data set</td> </tr> <tr> <td>USER DICTIONARY</td> <td>User Dictionary</td> </tr> <tr> <td>NAVTEQ POINT DATA</td> <td>NAVTEQ/HERE Points data set</td> </tr> <tr> <td>MASTER LOCATION</td> <td>Master Location Data</td> </tr> </table>	USPS	USPS	TIGER	TIGER	TOMTOM	TomTom Streets data set	SANBORN POINT DATA	Sanborn Points data set	NAVTEQ	NAVTEQ/HERE Streets data set	TOMTOM POINT DATA	TomTom Points data set	AUXILIARY	Auxiliary file	CENTRUS POINT DATA	Centrus Points data set	USER DICTIONARY	User Dictionary	NAVTEQ POINT DATA	NAVTEQ/HERE Points data set	MASTER LOCATION	Master Location Data

L	The address range occupies the left side of the street.																							
R	The address range occupies the right side of the street.																							
B	The address range occupies both sides of the street.																							
U	Undetermined.																							
USUrbanName	31	Urbanization name. Used for addresses in Puerto Rico.																						

DPV

DPV data output fields contain information about a match made using DPV data. GeocodeUSAddress only returns values when matching against DPV data. To include DPV data in the output, set `OutputRecordType = D`.

columnName	Max. Field Length with null terminator	Description
CMRA	2	<p>Indicates whether the address is for a Commercial Mail Receiving Agent (CMRA). A CMRA is a private company that rents out mailboxes. A customer of a commercial mail receiving agency can receive mail and other deliveries at the street address of the CMRA rather than the customer's own street address. Depending on the agreement between the customer and the CMRA, the CMRA can forward the mail to the customer or hold it for pickup.</p> <p>Y Yes, the address is a CMRA.</p> <p>N No, the address is not a CMRA.</p> <p>null DPV data is not available. DPV data is required to determine if an address is a CMRA.</p>
DPV	2	<p>Indicates whether the address is confirmed to be a deliverable address by USPS Delivery Point Validation (DPV).</p> <p>N Nothing confirmed</p> <p>Y Everything confirmed (ZIP+4, primary, and secondary)</p> <p>S ZIP+4 and primary (house number) confirmed</p> <p>D ZIP+4 and primary (house number) confirmed and a default match</p> <p>U Non-matched input address to USPS ZIP+4 data, or DPV data not loaded</p>

columnName	Max. Field Length with null terminator	Description
DPVFootnote	3 per footnote	<p>Contains detailed information about the address. The DPV footnote codes are combined together consecutively.</p> <p>DPV footnotes include:</p> <ul style="list-style-type: none"> • FOOTNOTE1 provides information about the matched DPV records. <ul style="list-style-type: none"> • AA—ZIP+4 matched record • A1—Failure to match a ZIP+4 record • null—Address not presented to hash table or DPV data not loaded • FOOTNOTE2 provides information about the matched DPV records. <ul style="list-style-type: none"> • BB—All DPV categories matched • CC—Matched primary/house number, where the secondary/unit number did not match (present but invalid) • M1—Missing primary/house number • M3—Invalid primary/house number • N1—Matched primary/house number, with a missing highrise secondary number • P1—Missing PS, RR, or HC Box number • P3—Invalid PS, RR or HC Box number • F1—All military addresses • G1—All general delivery addresses • U1—All unique ZIP Code addresses • null—Address not presented to hash table or DPV data not loaded • FOOTNOTE3 provides information about the matched DPV records. <ul style="list-style-type: none"> • R1—Matched CMRA, without a present secondary/unit number • RR—Matched CMRA • null—Address not presented to hash table or DPV data not loaded <p>Note: A unique ZIP Code is a ZIP Code assigned to a company, agency, or entity with sufficient mail volume to have its own ZIP Code.</p>

Geoconfidence

Geoconfidence data output fields contain information about the type of geoconfidence polygon returned. To include geoconfidence fields in the output, set `OutputRecordType = Z`.

columnName	Max. Field Length with null terminator	Description
GeoConfidenceCode	13	<p>The value returned in this field indicates which geoconfidence surface type has been returned.</p> <p>The possible values are:</p> <p>INTERSECTION A geocode point for the intersection of two streets.</p> <p>ADDRESS An array of street segment points representing the street segment where the address is located.</p> <p>POINT If the geocoder was able to match the address using point data, the point geometry where the address is located.</p> <p>POSTAL1 A geocode point for the ZIP centroid.</p> <p>POSTAL2 An array of points for all street segments in the ZIP + 2 in which the address is located.</p> <p>POSTAL3 An array of points for street segments in the ZIP + 4 in which the address is located.</p> <p>ERROR An error has occurred.</p>
StreetSegmentPoints	1024	<p>An array of latitude/longitude values that represent the street segment points.</p> <p>Note: This field contains values only if the <code>GeoConfidenceCode</code> field returns a value of <code>ADDRESS</code>, <code>POSTAL2</code>, or <code>POSTAL3</code>.</p>
GeoConfidenceCentroidLatitude	11	The latitude of the centroid of the geoconfidence polygon.
GeoConfidenceCentroidLongitude	12	The longitude of the centroid of the geoconfidence polygon.

Latitude/Longitude

The latitude/longitude output fields contain the geographic coordinates of the address. To include latitude/longitude output fields in the output, set `OutputRecordType = L`.

columnName	Max. Field Length with null terminator	Description
Elevation	11	The location's elevation in feet above or below sea level.
Latitude	11	The latitude of the address. The latitude is a seven-digit number in degrees, calculated to six decimal places.
Longitude	12	The longitude of the address. The longitude is a seven-digit number in degrees, calculated to six decimal places.

Parsed Elements

The parsed elements output fields contain standard address information as individual units, such as street suffixes (for example AVE, ST, or RD) and leading directionals (for example N and SE). To include parsed elements in the output, set `OutputRecordType = E`.

columnName	Max. Field Length with null terminator	Description
ApartmentLabel	5	The type of unit, such as apartment, suite, or lot.
ApartmentLabel2	5	The type of unit, such as apartment, suite, or lot, for addresses that contain two units, such as: 123 E Main St APT 3, 4th Floor .
ApartmentNumber	12	Apartment number. For example: 123 E Main St APT 3
ApartmentNumber2	12	Secondary apartment number. For example: 123 E Main St APT 3, 4th Floor

columnName	Max. Field Length with null terminator	Description
CrossStreetLeadingDirectional	3	<p>Leading directional, for example: 123 E Main St Apt 3</p> <p>Note: Cross street information is only returned if you entered an intersection as an address. For example, entering Pearl and 28th, Boulder, CO returns cross street information. Entering 2800 Pearl, Boulder, CO does not return cross street information.</p>
CrossStreetName	41	<p>Name of cross street.</p> <p>Note: Cross street information is only returned if you entered an intersection as an address. For example, entering Pearl and 28th, Boulder, CO returns cross street information. Entering 2800 Pearl, Boulder, CO does not return cross street information.</p>
CrossStreetSuffix	5	<p>Street suffix, for example: 123 E Main St Apt 3</p> <p>Note: Cross street information is only returned if you entered an intersection as an address. For example, entering Pearl and 28th, Boulder, CO returns cross street information. Entering 2800 Pearl, Boulder, CO does not return cross street information.</p>
CrossStreetTrailingDirectional	3	<p>Trailing directional, for example: 123 Pennsylvania Ave NW</p> <p>Note: Cross street information is only returned if you entered an intersection as an address. For example, entering Pearl and 28th, Boulder, CO returns cross street information. Entering 2800 Pearl, Boulder, CO does not return cross street information.</p>
HouseNumber	12	Building number for the address.
HouseNumber2	12	<p>If an address consists of a range of house numbers, this field contains the second house number. The HouseNumber field contains the first number. For example, given this address:</p> <p>5-7 Maple Ave.</p> <p>The HouseNumber field would contain "5" and the HouseNumber2 field would contain "7".</p>

columnName	Max. Field Length with null terminator	Description
LeadingDirectional	3	Leading directional, for example: 123 E Main St Apt 3
PrivateMailbox	9	Private mailbox. Not returned for multiline input.
PrivateMailbox.Designator	5	Private mailbox description. Not returned for multiline input.
RRHC	2	Rural Route/Highway Contract portion of the address.
StreetName	41	The name of the street, not including any directionals or suffixes. For example, the word "Main" in this address: 123 E Main St Apt 3
StreetSuffix	5	The street type of the matched location. For example, AVE for Avenue.
TrailingDirectional	3	Street directional that follows the street name. For example, the N in 456 Washington N.

Postal Data

Postal data output fields contain detailed postal information for the address, such as the preferred city name and the US carrier route. To include postal data fields in the output, set `OutputRecordType = P`.

columnName	Max. Field Length with null terminator	Description
CityPreferredName	29	The USPS® preferred city name for the ZIP Code of the address.

columnName	Max. Field Length with null terminator	Description
CityShortName	29	The USPS®-approved abbreviation for the city, if there is one. The USPS® provides abbreviations for city names that are 14 characters long or longer. City abbreviations are 13 characters or less and can be used when there is limited space on the mailing label. If there is no short city name for the city, then the full city name is returned.
CityStateRecordName	29	USPS® city state city name.
DeliveryPointCode	3	Two-digit delivery point barcode.
GovernmentBuilding	2	<p>Indicates if a building is used by the city, state, or federal government.</p> <p>A City government building</p> <p>B Federal government building</p> <p>C State government building</p> <p>D Firm only</p> <p>E City government building and firm only</p> <p>F Federal government building and firm only</p> <p>G State government building and firm only</p> <p>The values A, B, C, E, F, and G are valid for Alternate records only. The value D is valid for both base and alternate records.</p>
PostalBarCode	7	Six-digit combination of ZIP+4 Code and the delivery point barcode.
PostalCodeClass	2	<p>ZIP Classification code.</p> <p>null Standard ZIP Code</p> <p>M Military ZIP Code</p> <p>P ZIP Code has P.O. boxes only</p> <p>U Unique ZIP Code (ZIP Code assigned to a single organization)</p>

columnName	Max. Field Length with null terminator	Description
PostalCodeUnique	2	Indicates if the ZIP Code is a unique ZIP Code assigned to an individual company or agency. Y Unique ZIP name null No unique ZIP name
PostalFacility	2	USPS City State Name Facility code. A Airport Mail Facility (AMF) B Branch C Community Post Office (CPO) D Area Distribution Center (ADC) E Sectional Center Facility (SCF) F Delivery Distribution Center (DDC) G General Mail Facility (GMF) K Bulk Mail Center (BMC) M Money Order Unit N Non-Postal Community Name, Former Postal Facility, or Place Name P Post Office S Station U Urbanization
USBCCheckDigit	2	Check-digit for delivery point barcode.
USCarrierRouteCode	5	Carrier Route code.

columnName	Max. Field Length with null terminator	Description
USCarrierRouteSort	2	<p>Indicates if the USPS uses a carrier route sort, and what type of sort the USPS allows.</p> <p>A Automation cart allowed, optional cart merging allowed</p> <p>B Automation cart allowed, no optional cart merging allowed</p> <p>C No automation cart allowed, optional cart merging allowed</p> <p>D No automation cart allowed, no optional cart merging allowed</p>
USCityDelivery	2	<p>Indicates if has city-delivery carrier routes.</p> <p>Y Has city-delivery carrier routes</p> <p>N Does not have city-delivery carrier routes.</p>
USLACS	2	<p>Indicates if LACS^{Link} match occurred.</p> <p>Y Matched LACS^{Link} record</p> <p>N LACS^{Link} match not found</p> <p>F False-positive LACS^{Link} record</p> <p>S Secondary information (unit number) removed to make a LACS^{Link} match</p> <p>null Records not processed through LACS^{Link}</p> <p>For more information, see Locatable Address Conversion System (LACS) on page 180.</p>
USLACS.ReturnCode	3	<p>Indicates LACS^{Link} results.</p> <p>A Matched LACS^{Link} record</p> <p>00 LACS^{Link} match was not found</p> <p>09 Matched to highrise default, but noLACS^{Link} conversion</p> <p>14 Found LACS^{Link} match, but no LACS^{Link} conversion</p> <p>92 Secondary information (unit number) was removed to make a LACS^{Link} match</p> <p>null Records not processed through LACS^{Link}</p> <p>For more information, see Locatable Address Conversion System (LACS) on page 180.</p>

columnName	Max. Field Length with null terminator	Description
USLOTCode	2	A combination of the 4-digit Line of Travel (LOT) Code and the ascending (A) or descending (D) indicator.

Qualifiers

Qualifier output fields contain qualification information about the match, such as the location code and the match code. To include postal data fields in the output, set `OutputRecordType = Q`.

columnName	Max. Field Length with null terminator	Description
AddressLineResolved	5	<p>For two-line addresses, indicates which address line was used to obtain the match.</p> <ul style="list-style-type: none"> 0 The address could not be matched, or the address matched to multiple addresses. 1 AddressLine1 was used to obtain the match. 2 AddressLine2 was used to obtain the match. 3 Both address lines were used in their original order. 4 Both address lines were used but the order of the lines was switched to obtain the match. 5 The input address was a one line address.
CountryLevel	2	The category of the postal data used to validate the address. Always returns "A" for U.S. addresses. Category A means that the postal data is sufficient to validate and correct addresses, including providing missing postal code, city name, state/county name, street address elements, and country name.
DatabaseVersion		The publish date of the USPS data used to validate the address, in the format <code>Month Year</code> .

columnName	Max. Field Length with null terminator	Description
EWSMatch	2	<p>Indicates whether the address was not matched because it is in the Early Warning System (EWS) data.</p> <p>Y The address matched to an address in the EWS data so the match was denied.</p> <p>null The address did not match to an address in the EWS data.</p>
ExpirationDate	11	Date the database expires, in the format MM/DD/YYYY.
Geocoder.MatchCode	4	<p>Indicates how closely the input address matches the candidate address.</p> <p>Note: The match codes returned in this field are different from the match codes described in Match Codes on page 338. Instead, the match codes returned in this field are taken from a set of match codes that are compatible with all other country geocoders. For more information, see Result Codes for International Geocoding on page 361.</p>
GeoStanMatchScore	13	Record matching score (for multimatches only).
Intersection	2	<p>Indicates if the input address matched to a cross-street.</p> <p>T True</p> <p>F False</p>

columnName	Max. Field Length with null terminator	Description																												
IsAlias	4	<p>Indicates whether the address matched an index alias in the postal data. Returns three characters. The first is an N for normal street match or A for alias match (including buildings, aliases, firms, etc.). The next two characters are:</p> <table border="0"> <tr><td>01</td><td>Basic index (normal address match)</td></tr> <tr><td>02</td><td>USPS street name alias index</td></tr> <tr><td>03</td><td>USPS building index</td></tr> <tr><td>04</td><td>USPS firm name index</td></tr> <tr><td>05</td><td>Statewide intersection alias match</td></tr> <tr><td>06</td><td>Spatial data street name alias</td></tr> <tr><td>07</td><td>Alternate index</td></tr> <tr><td>08</td><td>LACS^{Link}</td></tr> <tr><td>09</td><td>Auxiliary file match</td></tr> <tr><td>10</td><td>Centrus Alias index (when using usca.gsi)</td></tr> <tr><td>11</td><td>POI index (when using poi.gsi)</td></tr> <tr><td>12</td><td>USPS Preferred Alias</td></tr> <tr><td>13</td><td>ZIPMove match (when using us.gsz)</td></tr> <tr><td>14</td><td>Expanded Centroids match (when using us_cent.gsc and/or bldgcent.gsc)</td></tr> </table>	01	Basic index (normal address match)	02	USPS street name alias index	03	USPS building index	04	USPS firm name index	05	Statewide intersection alias match	06	Spatial data street name alias	07	Alternate index	08	LACS ^{Link}	09	Auxiliary file match	10	Centrus Alias index (when using usca.gsi)	11	POI index (when using poi.gsi)	12	USPS Preferred Alias	13	ZIPMove match (when using us.gsz)	14	Expanded Centroids match (when using us_cent.gsc and/or bldgcent.gsc)
01	Basic index (normal address match)																													
02	USPS street name alias index																													
03	USPS building index																													
04	USPS firm name index																													
05	Statewide intersection alias match																													
06	Spatial data street name alias																													
07	Alternate index																													
08	LACS ^{Link}																													
09	Auxiliary file match																													
10	Centrus Alias index (when using usca.gsi)																													
11	POI index (when using poi.gsi)																													
12	USPS Preferred Alias																													
13	ZIPMove match (when using us.gsz)																													
14	Expanded Centroids match (when using us_cent.gsc and/or bldgcent.gsc)																													
IsCloseMatch	2	<p>Indicates whether or not the address was a unique match or if there were candidate addresses.</p> <table border="0"> <tr><td>Y</td><td>Yes, the address is a close match. This field always contains "Y" if there is only one match.</td></tr> <tr><td>N</td><td>No, the address is not a close match. The record is a candidate.</td></tr> </table>	Y	Yes, the address is a close match. This field always contains "Y" if there is only one match.	N	No, the address is not a close match. The record is a candidate.																								
Y	Yes, the address is a close match. This field always contains "Y" if there is only one match.																													
N	No, the address is not a close match. The record is a candidate.																													
LACSAddress	2	<p>Indicates if the input address was converted due to the Locatable Address Conversion System (LACS).</p> <table border="0"> <tr><td>L</td><td>Converted</td></tr> <tr><td>null</td><td>Not converted</td></tr> </table>	L	Converted	null	Not converted																								
L	Converted																													
null	Not converted																													

columnName	Max. Field Length with null terminator	Description
LocationCode.Description	128	LocationCode converted to text. Only returned when you set the configuration options to return additional descriptions (verbose).
MatchCode.Description	128	MatchCode converted to text. Only returned when you set the configuration options to return additional descriptions (verbose).
RecordType	18	Indicates the record type: <ul style="list-style-type: none"> • GeneralDelivery • HighRise • FirmRecord • Normal • PostOfficeBox • RRHighwayContract • Geographic (non USPS TIGER match) • Auxiliary (match to an auxiliary file)
RecordType.Default	2	Indicates type of match that occurred for the record type HighRise or RRHighwayContract: <p>Y Default match</p> <p>N Exact match</p> <p>U Not matched</p>

columnName	Max. Field Length with null terminator	Description																				
StreetDataCode	3	<p>Indicates the data used to geocode the address. One of the following:</p> <table border="0"> <tr><td>0</td><td>USPS data</td></tr> <tr><td>1</td><td>TIGER data</td></tr> <tr><td>2</td><td>TomTom data</td></tr> <tr><td>6</td><td>HERE data</td></tr> <tr><td>7</td><td>TomTom point-level data</td></tr> <tr><td>8</td><td>Centrus point-level data</td></tr> <tr><td>9</td><td>Auxiliary file data</td></tr> <tr><td>10</td><td>User Dictionary</td></tr> <tr><td>11</td><td>HERE point-level data</td></tr> <tr><td>12</td><td>Master Location Data</td></tr> </table> <p>For more information about these databases, see Enterprise Geocoding Databases on page 173.</p>	0	USPS data	1	TIGER data	2	TomTom data	6	HERE data	7	TomTom point-level data	8	Centrus point-level data	9	Auxiliary file data	10	User Dictionary	11	HERE point-level data	12	Master Location Data
0	USPS data																					
1	TIGER data																					
2	TomTom data																					
6	HERE data																					
7	TomTom point-level data																					
8	Centrus point-level data																					
9	Auxiliary file data																					
10	User Dictionary																					
11	HERE point-level data																					
12	Master Location Data																					
StreetDataType	20	<p>Indicates the data initially used for the match attempt. Note that the output field StreetDataCode shows which data was actually used to obtain the match.</p> <p>The data indicated in StreetDataType may be different from that in StreetDataCode if a match cannot be made in the initial match attempt. For example, if a points database is loaded, GeocodeUSAddress will first attempt a match to the point data because this is the most accurate type of match. If a point-level match cannot be made, GeocodeUSAddress will attempt to match to street data. If the match is made using street data, then the StreetDataType would indicate the point-level data and the StreetDataCode would indicate the street data.</p> <p>For more information, see How GeocodeUSAddress Processes Addresses on page 207.</p>																				

Range

Range output fields contain information about the street range, such as the high and low unit numbers. To include range data fields in the output, set `OutputRecordType = R`.

columnName	Max. Field Length with null terminator	Description
Alternate	2	USPS code that specifies whether a record is a base or alternate record. B Base record. Base records can represent a range of addresses or an individual address, such as a firm record. A Alternate record. Alternate records are individual delivery points.
HouseNumberHigh	12	The highest house number in the range.
HouseNumberLow	12	The lowest house number in the range.
HouseNumberParity	2	Indicates if the house number range contains even or odd numbers. E Even O Odd B Both
PostalCodeExtensionHigh	5	The highest four-digit ZIP Code extension in the range. The ZIP Code extension is the four digits at the end of the ZIP Code. For example: 60510- 1134 .
PostalCodeExtensionLow	5	The lowest four-digit ZIP Code extension in the range. The ZIP Code extension is the four digits at the end of the ZIP Code. For example: 60510- 1134 .
UnitNumberHigh	12	The highest unit number in the range.
UnitNumberLow	12	The lowest unit number in the range.

columnName	Max. Field Length with null terminator	Description
UnitNumberParity	2	Indicates if the unit number range contains even or odd numbers. E Even O Odd B Both

Segment

Segment output fields contain information about the street segment identified by the data provider. To include segment data fields in the output, set `OutputRecordType = S`.

columnName	Max. Field Length with null terminator	Description
BlockLeft	16	The Census FIPS Code that indicates the address is on the left side of the street.
BlockRight	16	The Census FIPS Code that indicates the address is on the right side of the street.
BlockSuffixLeft	2	The block suffix of the block on the left side of the street. A block suffix is a single character assigned to subsections of U.S. Census blocks that are split by a higher-level boundary, such as a municipal boundary. A block suffix is either "A" or "B". For information about U.S. Census block suffixes, see the <i>Geographic Areas Reference Manual</i> , available at the U.S. Census Bureau website: www.census.gov/geo/www/garm.html Block suffixes are only available if you are using Centrus Enhanced data.

columnName	Max. Field Length with null terminator	Description								
BlockSuffixRight	2	<p>The block suffix of the block on the right side of the street.</p> <p>A block suffix is a single character assigned to subsections of U.S. Census blocks that are split by a higher-level boundary, such as a municipal boundary. A block suffix is either "A" or "B". For information about U.S. Census block suffixes, see the <i>Geographic Areas Reference Manual</i>, available at the U.S. Census Bureau website:</p> <p>www.census.gov/geo/www/garm.html</p> <p>Block suffixes are only available if you are using Centrus Enhanced data.</p>								
PointCode	11	<p>Unique point ID of the matched record when matched to point-level data. <i>Blank</i> if the matched record is not from point-level data.</p>								
RoadClass	3	<p>The type of road:</p> <table border="0"> <tr> <td>1</td> <td>Major</td> </tr> <tr> <td>2</td> <td>Minor</td> </tr> </table>	1	Major	2	Minor				
1	Major									
2	Minor									
SegmentCode	11	<p>The unique 10-digit street segment ID assigned by the street network data provider.</p>								
SegmentDirection	2	<p>Indicates the order of numbers on a segment.</p> <table border="0"> <tr> <td>F</td> <td>Forward</td> </tr> <tr> <td>R</td> <td>Reversed</td> </tr> <tr> <td>B</td> <td>Both</td> </tr> <tr> <td>U</td> <td>Undetermined</td> </tr> </table>	F	Forward	R	Reversed	B	Both	U	Undetermined
F	Forward									
R	Reversed									
B	Both									
U	Undetermined									
SegmentHouseNumberHigh	12	<p>The highest house number in the segment.</p>								
SegmentHouseNumberLow	12	<p>The lowest house number in the segment.</p>								
SegmentLength		<p>The length, in feet, of a block segment. <i>This field is deprecated.</i></p>								

columnName	Max. Field Length with null terminator	Description
SegmentParity	2	<p>Indicates which side of the street has odd numbers.</p> <p>L Left side of the street</p> <p>R Right side of the street</p> <p>B Both sides of the street</p> <p>U Undetermined</p>
StreetSide.NAVTEQ	2	<p>Indicates which side of the street the address is located on. The value in this field is determined by using the NAVTEQ/HERE reference nodes for the street segment. A street segment represents part of a street. Each segment has a node at each end: the reference node and the non-reference node. The reference node is the node with the lower latitude (southernmost). If the latitudes of both nodes are identical, the reference node is the end node with the lower longitude (westernmost). The street side corresponds to the street sides you would see if you were standing at the reference node and looking at the non-reference node.</p> <p>One of the following:</p> <p>L The address is on the left side of the street.</p> <p>R The address is on the right side of the street.</p> <p>B The address occupies both sides of the street.</p> <p>U The street side is unknown.</p> <p>null NAVTEQ/HERE data was not used, or segment output data was not selected, or the address did not match a street segment (for example, the address was geocoded to a centroid).</p>

GNAFPIDLocationSearch

GNAFPIDLocationSearch identifies the address and latitude/longitude coordinates for a Geocoded National Address File Persistent Identifier (G-NAF PID). The G-NAF PID is a 14-character alphanumeric string that uniquely identifies each G-NAF address in the G-NAF database (a database of Australian locations). The PID is constructed from a combination of the major address fields of the G-NAF database. An example of a G-NAF PID is:

GAACT718519668

Note: You must have the G-NAF database installed to use GNAFPIDLocationSearch.

GNAFPIDLocationSearch is part of the Geocoding Address AUS component.

For more information about the Enterprise Geocoding Module, see [Enterprise Geocoding Module](#) on page 172.

G-NAF PID Input

GNAFPIDLocationSearch takes a G-NAF PID as input and returns the address and latitude/longitude coordinates for a Geocoded National Address File Persistent Identifier (G-NAF PID).

Note: GNAF PID Location Search functionality is not supported by the Geocode Address Global component. You must use the Geocode Address AUS component for this functionality.

Table 32: GNAFPIDLocationSearch Input

columnName	Format	Description
GNAFPID	String	The 14-character G-NAF persistent identifier you want to look up. For example: GAACT718519668

Note: Specify input using the `DataTable` class. For more information, see the Spectrum™ Technology Platform API Guide.

G-NAF PID Location Search Options

GNAFPIDLocationSearch includes an option to select the G-NAF database for the PID search.

*G-NAF Geocoding Options***Table 33: GNAFPIDLocationSearch Geocoding Options**

optionName	Description
GNAFPointType	<p>Specifies whether to return the parcel latitude/longitude or the street frontage latitude/longitude. This option is only available if you have the G-NAF database installed. This option only affects addresses matched to the G-NAF database.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P In a street address match, return the exact location of the parcel. This is the standard G-NAF point which is the exact authoritative point returned by the G-NAF database. Default. S In a street address match, return the street frontage point for the parcel. The street frontage point is 12.5 metres from the front boundary of the parcel. Street frontage points are more suitable for routing applications.
Return8DecimalPlaceLatLong	<p>Specifies whether to return the original latitude and longitude, precise up to eight digits after the decimal. This is the latitude/longitude that the candidate matched to in the G-NAF database. These are the original coordinates directly from the G-NAF data prior to truncation or rounding. This option is only available if you have the G-NAF database installed. This option only affects addresses matched to the G-NAF database.</p> <ul style="list-style-type: none"> Y Yes, return the original latitude/longitude, up to eight digits after the decimal. N No, do not return the original latitude/longitude.

G-NAF PID Data Options

Table 34: GNAFPIDLocationSearch Data Options

optionName	Description
Database	<p>Specifies the database to use to look up the parcel. Use the database name specified in the Management Console. For more information, see the <i>Spectrum™ Technology Platform Administration Guide</i>.</p> <p>Note: Only database resources that contain G-NAF databases are available in this list.</p>

Output

Address Output

Table 35: Address Output

columnName	Description
AddressLine1	First line of the address.
AddressLine2	Second line of the address.
ApartmentLabel	The type of unit, such as apartment, suite, or lot.
ApartmentNumber	Unit number.
City	Municipality name.
Country	The three-letter ISO 3166-1 Alpha 3 country code.
County	The Local Government Authority (LGA).

columnName	Description
FirmName	Name of the company or a place name.
HouseNumber	Building number for the matched location.
HouseNumberHigh	The highest house number of the range in which the address resides.
HouseNumberLow	The lowest house number of the range in which the address resides.
HouseNumberParity	Indicates if the house number range contains even or odd numbers or both. E Even O Odd B Both
LastLine	Complete last address line (city, state/province, and postal code).
LeadingDirectional	Street directional that precedes the street name. For example, the N in 138 N Main Street.
Locality	Generally a locality in rural areas or suburb in urban areas.
NumberOfCandidateRanges	Indicates whether or not the address has a house number. One of the following: 0 The address has no house number. Examples of addresses that have no house number are P.O. box addresses and general delivery addresses. 1 The address has a house number. For information about the range in which the house number falls, see the HouseNumberHigh, HouseNumberLow, and HouseNumberParity fields.
NumberOfRangeUnits	Indicates whether or not the address has a unit number, such as a suite number or apartment number. One of the following: 0 The address has no unit number. 1 The address has a unit number. For information about the range in which the unit number falls, see the UnitNumberHigh and UnitNumberLow.

columnName	Description
PostalCode	The postal code for the address. The format of the postcode varies by country.
PostalCode.Addon	The second part of the postcode. For example, for Canadian addresses this will be the LDU. This field is not used by most countries.
PreAddress	Miscellaneous information that appears before the street name.
PrivateMailbox	This field is not currently used.
SegmentParity	Indicates which side of the street has odd numbers. L Left side of the street R Right side of the street B Both sides of the street U Undetermined
StateProvince	The state name.
StreetDataType	The default search order rank of the database used to geocode the address. A value of "1" indicates that the database is first in the default search order, "2" indicates that the database is second in the default search order, and so on. The default database search order is specified in the Management Console with the Spectrum Databases page.
StreetName	The street name.
StreetPrefix	The type of street when the street type appears before the base street name. For example, AVENUE: 12 AVENUE B KALGOORLIE WA 6430
StreetSuffix	The street type of the matched location. For example, AVE for Avenue.

columnName	Description
TrailingDirectional	Street directional that follows the street name. For example, the N in 456 Washington N.
UnitNumberHigh	The highest unit number of the range in which the unit resides.
UnitNumberLow	The lowest unit number of the range in which the unit resides.

Geocode Output

Table 36: Geocode Output

columnName	Description
CoordinateSystem	The coordinate system used to determine the latitude and longitude coordinates. A coordinate system specifies a map projection, coordinate units, etc. An example is EPSG:4326. EPSG stands for European Petroleum Survey Group.
Latitude	Seven-digit number in degrees and calculated to four decimal places (in the format specified).
Longitude	Seven-digit number in degrees and calculated to four decimal places (in the format specified).

Result Codes

Result codes contain information about the success or failure of the geocoding attempt, as well as information about the accuracy of the geocode.

Note: As the EGM Module transitions its administrative tasks to a web-based Management Console, labels for the options may use different wording than what you see in Enterprise Designer. There is no difference in behavior.

Table 37: Result Code Output

columnName	Description
Geocoder.MatchCode	Indicates how closely the input address matches the candidate address.
IsCloseMatch	<p>Indicates whether or not the address is considered a close match. An address is considered close based on the "Close match criteria" options on the Matching tab.</p> <p>Y Yes, the address is a close match.</p> <p>N No, the address is not a close match.</p>
MultiMatchCount	<p>For street address geocoding, the number of matching address positions found for the specified address.</p> <p>For intersection geocoding, the number of matching street intersection positions found for the specified addresses.</p>
Status	<p>Reports the success or failure of the match attempt</p> <p>null Success</p> <p>F Failure</p>
Status.Code	<p>If the geocoder could not process the address, this field will show the reason.</p> <ul style="list-style-type: none"> • Internal System Error • No Geocode Found • Insufficient Input Data • Multiple Matches Found • Exception occurred • Unable to initialize Geocoder • No Match Found

columnName	Description
Status.Description	<p>If the geocoder could not process the address, this field will show a description of the failure.</p> <p>Problem + explanation Returned when Status.Code = Internal System Error.</p> <p>Geocoding Failed Returned when Status.Code = No Geocode Found.</p> <p>No location returned Returned when Status.Code = No Geocode Found.</p> <p>No Candidates Returned The geocoder could not identify any candidate matches for the address.</p> <p>Multiple Candidates Returned and Keep Multiple Matches not selected The address resulted in multiple candidates. In order for the candidate address to be returned, you must specify <code>KeepMultimatch=Y</code>.</p>

columnName	Description
LocationPrecision	<p>A code describing the precision of the geocode. One of the following:</p> <p>0 No coordinate information is available for this candidate address.</p> <p>1 Interpolated street address.</p> <p>2 Street segment midpoint.</p> <p>3 Postal code 1 centroid.</p> <p>4 Partial postal code 2 centroid.</p> <p>5 Postal code 2 centroid.</p> <p>6 Intersection.</p> <p>7 Point of interest. This is a placeholder value. Spectrum databases do not have POI data, so it is not possible to get this return.</p> <p>8 State/province centroid.</p> <p>9 County centroid.</p> <p>10 City centroid.</p> <p>11 Locality centroid.</p> <p>12 - 15 (LocationPrecision codes) For most countries, LocationPrecision codes 12 through 15 are reserved for unspecified custom items.</p> <p>13 Additional point precision for unspecified custom item.</p> <p>14 Additional point precision for unspecified custom item.</p> <p>15 Additional point precision for unspecified custom item.</p> <p>16 The result is an address point.</p> <p>17 The result was generated by using address point data to modify the candidates segment data.</p> <p>18 The result is an address point that was projected using the centerline offset feature. You must have both a point and a street range database to use the centerline offset feature, and thereby return LocationPrecision 18.</p>
StreetDataType	<p>The default search order rank of the database used to geocode the address. A value of "1" indicates that the database is first in the default search order, "2" indicates that the database is second in the default search order, and so on.</p>

G-NAF Output

The following table lists output fields that are unique to the Australian Geocoded National Address File (G-NAF[®]) database. G-NAF is an optional database that is available for all six states and two territories. G-NAF is the only authoritative Australian national index of locality, street and number, validated with geographic coordinates.

Table 38: Australia G-NAF Output

columnName	Description
AUS.GNAF_ADDRESS_CLASS	<p>The Address_Class is constructed using a combination of elements from the G-NAF Data Dictionary source tables. The components of the Address_Class field are:</p> <p>A Alias address record</p> <p>P Principal address record</p> <p>PP Principal primary address record</p> <p>PS Principal secondary address record</p> <p>AP Alias primary address record</p> <p>AS Alias secondary address record</p>
AUS.GNAF_CONFIDENCE	<p>A number indicating how many G-NAF datasets the address is found in. A higher confidence level means that the same address was found in more data contributor sources. One of the following:</p> <p><number> The number of datasets the address was found in, minus 1. For example, a value of 0 indicates that the address was found in one contributor's dataset, a value of 1 indicates that the address was found in two contributors' datasets, a value of 2 indicates that the address was found in three contributors' datasets, and so forth.</p> <p>-1 The address could not be found in any G-NAF dataset.</p>
AUS.GNAF_EIGHT_DECIMAL_PLACE_LATITUDE	<p>The parcel latitude, precise to eight digits after the decimal. This is the latitude that the candidate matched to in the G-NAF database. These are the original coordinates directly from the G-NAF data prior to truncation or rounding.</p> <p>This field is only returned if you specify Return8DecimalPlaceLatLong=Y.</p>

columnName	Description
AUS.GNAF_EIGHT_DECIMAL_PLACE_LONGITUDE	<p>The parcel longitude, precise to eight digits after the decimal. This is the longitude that the candidate matched to in the G-NAF database. These are the original coordinates directly from the G-NAF data prior to truncation or rounding.</p> <p>This field is only returned if you specify Return8DecimalPlaceLatLong=Y.</p>
AUS.GNAF_GEOCODE_LEVEL	<p>A number indicating the level of geocode for the address. Every principal address within the G-NAF database has at least a locality level geocode. They may also have a street level geocode and a point level geocode.</p> <p>One of the following:</p> <ul style="list-style-type: none"> 0 No geocode. 1 Parcel level geocode only (no locality or street level geocode). 2 Street level geocode only (no locality or parcel level geocode). 3 Street and parcel level geocodes (no locality geocode). 4 Locality level geocode only (no street or parcel level geocode). 5 Locality and parcel level geocodes (no street level geocode). 6 Locality and street level geocodes (no parcel level geocodes). 7 Locality, street and parcel level geocodes.
AUS_GNAF_PARCEL_ID	<p>The Parcel ID field is the generic parcel id field provided by custodial data, and represents a Lot on Plan description that is useful for government agencies. The exact format varies. G-NAF source data has over 7 million records with a Parcel_ID. The Australia geocoder supplements this to populate over 12,730,000 G-NAF records with a Parcel_ID field.</p>

columnName	Description
AUS.GNAF_PID	<p>The G-NAF Persistent Identifier (G-NAF PID) is a 14-character alphanumeric string that uniquely identifies each G-NAF address. The PID is constructed from a combination of the major address fields of the G-NAF database. An example of a G-NAF PID is:</p> <p>GAACT718519668</p>
AUS.GNAF_RELIABILITY	<p>A number indicating the geocode precision. Reliability is related to the dictionary used to determine the geocode. Data with geocoded reliability levels 1, 2, and 3 is contained in the GNAF123 Dictionary. This is point (parcel) level geocoded data. Data with geocoded reliability levels 4, 5, and 6 is contained in the GNAF456 Dictionary. This contains non-parcel centroid geocoded data.</p> <ol style="list-style-type: none">1 Geocode accuracy recorded to appropriate surveying standard. For example, this could apply to an address level geocode that was manually geocoded. Geocode resolution is sufficient to place the centroid within address site boundary with a GPS.2 Geocode accuracy sufficient to place centroid within address site boundary. For example, this could apply to an address level geocode that was automatically calculated as the centroid of the corresponding cadastre parcel.3 Geocode accuracy sufficient to place centroid near (or possibly within) address site boundary. For example, this could apply to an address level geocode that was automatically calculated by calculating where on the road the address was likely to appear based upon other bounding geocoded addresses.4 Geocode accuracy sufficient to associate address site with a unique road feature. For example, this could apply to a street level geocode that was automatically calculated by using the road centerline reference data.5 Geocode resolution sufficient to associate address site with a unique locality or neighborhood. For example, this could apply to a locality level geocode that was automatically calculated as the centroid of the locality.6 Geocode resolution sufficient to associate address site with a unique region. For example, this could apply to a locality level geocode that was derived from topographic feature.

columnName	Description
AUS.GNAF_SA1	<p>The Statistical Area Level 1 (SA1) field as the second smallest geographic area defined in the Australian Statistical Geography Standard (ASGS). Mesh Block is the smallest unit. The SA1 is designed for use in the Census of Population and Housing as the smallest unit for the processing and release of Census data. An SA1 is represented by a unique seven digit code.</p>
AUS.LEVEL_NUMBER	<p>The number of a floor or level in a multistory building. For example,</p> <p>Floor 2, 17 Jones Street</p> <p>The G-NAF database includes level information for some Australian states. Level information may be associated with unit information, but not necessarily. If the G-NAF database contains multiple records with the same level, the level information is returned only if the input address contains unique content (such as a unit number). If the G-NAF database has level information for an address, that information is returned with the matched candidate.</p> <p>The correct level information is returned (when available) even if the input address did not include level information, or if the input had the wrong level information. If the input address has level information but the G-NAF database does not include level information for the matching address, then the input level information is discarded since it is not validated in the G-NAF data.</p>

columnName	Description
AUS.LEVEL_TYPE	<p>The label used for a floor of a multistory building. For example, "Level" or "Floor". In this example, the level type is "Level":</p> <p>Suite 3 Level 7, 17 Jones Street</p> <p>In this example, Suite 3 is a unit.</p> <p>The G-NAF database includes level information for some Australian states. Level information may be associated with unit information, but not necessarily. If the G-NAF database contains multiple records with the same level, the level information is returned only if the input address contains unique content (such as a unit number). If the G-NAF database has level information for an address, that information is returned with the matched candidate.</p> <p>The correct level information is returned (when available) even if the input address did not include level information, or if the input had the wrong level information. If the input address has level information but the G-NAF database does not include level information for the matching address, then the input level information is discarded since it is not validated in the G-NAF data.</p>
AUS.MESH_BLOCK_ID	<p>A Meshblock is the smallest geographic unit for which statistical data is collected by the Australian Bureau of Statistics (ABS). Meshblocks usually contain a minimum of 20 to 50 households. This is about one fifth the size of a Collection District (CD). You can use the Meshblock ID to do additional attributions against your own data.</p>
AUS.LOT_NUMBER	<p>Lot numbers are returned for G-NAF candidates because some rural addresses do not have adequate physical or house number information.</p>
AUS.STREET_TYPE_ABB	<p>This is an abbreviation for the street type. For example, EX is an abbreviation for Extension and FTRL is an abbreviation for Firetrail.</p>

ReverseAPNLookup

ReverseAPNLookup allows you to look up an address using:

- An Assessor's Parcel Number (APN). An APN is an ID number assigned to a piece of land by a county assessor. An APN is unique only within a county.
- A FIPS county code. A Federal Information Processing Standard (FIPS) code is an ID number assigned to a county by the U.S. Federal government.
- A FIPS state code. A FIPS state code is an ID number assigned to each state by the U.S. Federal government.

These three pieces of information, used together, can uniquely identify a specific parcel. You must use all three pieces of information to perform a lookup using ReverseAPNLookup.

Note: ReverseAPNLookup only works for U.S. addresses for which APN data is available, such as Centrus Enhanced or Centrus Premium Points. See the coverage map included with the points database for more information.

ReverseAPNLookup is part of the Enterprise Geocoding Module. For more information about the Enterprise Geocoding Module, see [Enterprise Geocoding Module](#) on page 172.

ReverseAPNLookup

Input

Reverse APNLookup Input Data

ReverseAPNLookup takes an APN, FIPS county code, and FIPS state code as input. The following table provides information about the format and layout of the input.

columnName	Format	Description
APN	String [45]	The assessor's parcel number (APN) for the property you want to look up.
InputKeyValue	String	User-defined data, such as a record ID or source code.
USFIPSCountyNumber	String [5]	The FIPS county code for the county in which the property resides.
USFIPSStateCode	String [2]	The FIPS state code for the state in which the property resides.

Options

The following table lists the options that control ReverseAPNLookup processing.

Note: As the Enterprise Geocoding Module transitions its administrative tasks to a web-based Management Console, labels for the options may use different wording than what you see in Enterprise Designer. There is no difference in behavior.

optionName	Description
Dataset	Specifies the database to use to look up the parcel. Use the database name specified in Management Console's Spectrum Databases page.
LatLongFormat	<p>Specifies the format for returned latitude/longitude.</p> <p>Decimal (90.000000-180.000000) Default.</p> <p>Integer (90000000-180000000)</p>
RetrieveElevation	<p>Specifies whether ReverseAPNLookup returns the elevation of the address. Elevation is the distance above or below sea level of a given location. The elevation is returned in the Elevation output field, which is part of the Latitude/Longitude output group.</p> <p>Note: This option requires that you have licensed and installed the Centrus Premium Points database. Elevation data is not available for all addresses. See the coverage map included with the points database.</p> <p>Y Return elevation data.</p> <p>N Do not return elevation data. Default.</p>
OutputCasing	<p>Specifies the casing of the output data.</p> <p>M Returns the output in mixed case. Default. For example:</p> <p>123 Main St Mytown FL 12345</p> <p>U Returns the output in upper case. For example:</p> <p>123 MAIN ST MYTOWN FL 12345</p>

optionName	Description
OutputVerbose	<p>Specifies whether ReverseAPNLookup provides an additional description field as output. This field provides the text equivalent to a field represented by a code. For example, <code>LocationCode</code> returns a code that indicates the accuracy (quality) of the assigned geocode. <code>LocationCode.Description</code> provides the description for the code returned.</p> <p>Y Include verbose fields.</p> <p>N Do not include verbose fields. Default.</p>
OutputRecordType	<p>Specifies optional data to include in the output. Note that ReverseAPNLookup always returns the default data listed in Default Output on page 289. The data you select here is returned with the default output data.</p> <ul style="list-style-type: none"> • C—Census • L—Latitude/Longitude • E—Parsed Elements • Q—Qualifiers • R—Range • S—Segment <p>For a list of fields included in each record type, see Output on page 287.</p> <p>If you do not want all of the fields in a group returned, do not select the group, and instead list only those fields you want returned in <code>OutputFields</code>.</p>
OutputFields	<p>Indicates the individual output fields you want returned. List fields with a pipe () between each field. You can use this field instead of the <code>OutputRecordType</code> field to limit the output to the specific fields you want.</p> <p>Default list: <code>AddressLine1 LastLine Longitude Latitude MatchCode LocationCode</code></p>

Output

ReverseAPNLookup always returns a default set of output fields that contain the address, geocode, and result indicators. For information about these fields, see [Default Output](#) on page 289. You can also choose to include optional categories of output data.

Census

Census output fields contain U.S. Census information about the address. To include census data in the output, set `OutputRecordType = C`.

Note: The following Census output fields - `CBSADivisionName`, `CBSAName`, `CSAName` and `USCountyName` - are only returned when you set the option `OutputVerbose=Y`.

columnName	Max. Field Length with null terminator	Description
BlockSuffix	2	Single character block suffix for split Census blocks. Returns A or B. Only available in Centrus Enhanced data.
CBSACode	6	Indicates Core Based Statistical Area (CBSA).
CBSADivisionCode	6	Denotes a subdivision of a CBSA.
CBSADivisionName	128	<p>The name of the Core Based Statistical Area (CBSA) division in which the address is located.</p> <p>A CBSA division is a metropolitan statistical area with a population of at least 2.5 million that has been subdivided to form smaller groupings of counties referred to as "metropolitan divisions." For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website:</p> <p>www.census.gov/population/www/metroareas/metroarea.html</p> <p>Note: The CBSA division name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
CBSAMetro	2	<p>Metropolitan Statistical Area. Valid values include:</p> <p>Y Metro statistical area</p> <p>N Micro statistical area</p> <p>null Data unavailable</p>
CBSAName	128	<p>The name of the core based statistical area (CBSA) in which the address is located.</p> <p>A CBSA is a collective term that refers to both metropolitan and micropolitan areas. A metropolitan area has a population of more than 50,000, and a micropolitan area has a population between 10,000 and 49,999. For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website:</p> <p>www.census.gov/population/www/metroareas/metroarea.html</p> <p>Note: The CBSA name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>

columnName	Max. Field Length with null terminator	Description
CensusBlockID	16	The ID of the Census Federal Information Processing Standard (FIPS) code.
CensusTract	7	Six digits extracted from the CensusBlockID.
CSACode	4	Denotes the code for a geographic entity that consists of 2 or more adjacent CBSAs with employment interchange measures of at least 15.
CSAName	128	<p>The name of the combined statistical area (CSA) in which the address is located.</p> <p>A CSA is a combination of two or more adjacent Core Based Statistical Areas (CBSAs) with a high employment interchange measure. The employment interchange measure is the sum of the percentage of employed residents of the smaller entity who work in the larger entity and the percentage of the employment in the smaller entity that is accounted for by workers who reside in the larger entity. Pairs of CBSAs with employment interchange measures of at least 25% combine automatically. Pairs of CBSAs with employment interchange measures of at least 15%, but less than 25%, may combine if local opinion in both areas favors combination.</p> <p>Note: The CSA name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
USCountyName	128	<p>The name of the county or parish in which the address is located.</p> <p>Note: The county/parish name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
USFIPSStateCountyCode	6	Five-digit FIPS code for state and county extracted from the CensusBlockID.

Default Output

Default Output Fields

ReverseAPNLookup always returns the address, geocode, and result indicators.

columnName	Max. Field Length with null terminator	Description
AdditionalInputData	61	This field may contain input data that was not used for matching; for example, input address information that appears after a mail stop or attention designator.
AddressLine1	104	First line of the address.
AddressLine2	104	Second line of the address.
APN	46	The Assessor's Parcel Number that was specified in the input.
City	29	Municipality name.
Confidence	4	Indicates the confidence in the output provided. The range is from 0 (zero) to 100, with 0 being no match and 100 being an exact match.
Country	25	The name of the country. Since ReverseAPNLookup only works for U.S. locations, this field will always contain United States of America .
Distance	8	The distance, in feet, from the input geocode to nearest matched address or intersection.
Elevation	11	The distance in feet above or below sea level of the parcel.
FirmName	41	Name of the company.
LastLine	61	Complete last address line (municipality, state, and postal code).
Latitude	11	Seven-digit number in degrees and calculated to 4 decimal places (in the format specified).

columnName	Max. Field Length with null terminator	Description
LocationCode	5	Indicates the accuracy (quality) of the assigned geocode. For more information, see Address Location Codes on page 346.
Longitude	12	Seven-digit number in degrees and calculated to 4 decimal places (in the format specified).
MatchCode	5	Indicates the portions of the address that matched to the directory file. For more information, see Match Codes on page 338.
PercentGeocode	6	The percent along the street segment that matches the geocode. For example, if the returned geocode falls 1/3 along the way of the entire street segment, the percent is 33.000. Note: This value is always 0.0 for matches to point-level data and intersections.
PostalCode	10	Nine-digit ZIP Code with or without a hyphen.
PostalCode.AddOn	5	Four-digit ZIP Code extension.
PostalCode.Base	6	Five-digit ZIP Code.
ProcessedBy	4	The feature code for the stage that processed the request. The value is EnterpriseGeocoding for ReverseAPNLookup.
StateProvince	3	Two-character state abbreviation.
Status	2	Reports the success or failure of the match attempt null Success F Failure

columnName	Max. Field Length with null terminator	Description
Status.Code	23	Reason for failure: <ul style="list-style-type: none"> • Internal System Error • No Address Found • Insufficient Input Data
Status.Description	128	Description of the problem: <p>Problem + explanation Returned when Status.Code = Internal System Error.</p> <p>Geocoding Failed Returned when Status.code = No Address Found.</p> <p>No location returned Returned when Status.code = No Address Found.</p>
StreetDataType	20	The data set that ReverseAPNLookup attempted to match against. <p>USPS USPS</p> <p>TIGER TIGER</p> <p>TOMTOM TomTom Streets data set</p> <p>SANBORN POINT DATA Sanborn Points data set</p> <p>NAVTEQ NAVTEQ Streets data set</p> <p>TOMTOM POINT DATA TomTom Points data set</p> <p>AUXILIARY Auxiliary file</p> <p>CENTRUS POINT DATA Centrus Points data set</p> <p>USER DICTIONARY User Dictionary</p> <p>NAVTEQ POINT DATA NAVTEQ/HERE Points data set</p> <p>MASTER LOCATION Master Location Data</p>
StreetSide	2	Indicates the side of the street the range occupies. One of the following: <p>L The range occupies the left side of the street.</p> <p>R The range occupies the right side of the street.</p> <p>B The range occupies both sides of the street.</p> <p>U Undetermined.</p>

columnName	Max. Field Length with null terminator	Description
USFIPSCountyNumber	4	Three-digit FIPS county code specified in the input.
USFIPSStateCode	3	Two-digit FIPS state code specified in the input.
USUrbanName	6	USPS® urbanization name. Puerto Rican addresses only.

Latitude/Longitude

The latitude/longitude output fields contain the geographic coordinates of the location and elevation. To include latitude/longitude output fields in the output, set `OutputRecordType = L`.

columnName	Max. Field Length with null terminator	Description
Elevation	11	The distance in feet above or below sea level of the parcel.
Latitude	11	7-digit number in degrees and calculated to 4 decimal places (in the format specified).
Longitude	12	7-digit number in degrees and calculated to 4 decimal places (in the format specified).

Parsed Elements

The Parsed Elements output fields contain standard address information as individual units, such as street suffixes (AVE) and leading directionals (N and SE). To include parsed elements in the output, set `OutputRecordType = E`.

columnName	Max. Field Length with null terminator	Description
ApartmentLabel	5	Apartment designator (such as STE or APT), for example: 123 E Main St. APT 3
ApartmentLabel2	5	Secondary apartment designator, for example: 123 E Main St. APT 3, 4th Floor
ApartmentNumber	12	Apartment number, for example: 123 E Main St. APT 3
ApartmentNumber2	12	Secondary apartment number, for example: 123 E Main St. APT 3, 4th Floor
City	29	Municipality name.
CrossStreetLeadingDirectional	3	Leading directional, for example: 123 E Main St. Apt 3
CrossStreetName ¹	41	Cross street name, for example: 123 E Main St. Apt 3
CrossStreetSuffix	5	Cross street suffix, for example: 123 E Main St. Apt 3
CrossStreetTrailingDirectional	3	Cross street trailing directional, for example: 123 Pennsylvania Ave NW
HouseNumber	12	Building number, for example: 123 E Main St. Apt 3 Note: This is an approximate building number based on the APN, FIPS county code, and FIPS state code provided. This approximate address may not exist or may not accept mail delivery.

¹ ReverseAPNLookup only returns Cross street outputs if you entered an intersection as an address. For example, entering Pearl and 28th, Boulder, CO returns cross street information. Entering 2800 Pearl, Boulder, CO does NOT return cross street information.

columnName	Max. Field Length with null terminator	Description
LeadingDirectional	3	Leading directional, for example: 123 E Main St. Apt 3
PrivateMailbox	9	Private mailbox indicator. Not output for multiline input.
PrivateMailbox.Designator	5	The type of private mailbox. Possible values include: <ul style="list-style-type: none"> • Standard • Non-Standard
RRHC	2	Rural Route/Highway Contract indicator.
StreetName	41	Street name, for example: 123 E Main St. Apt 3
StreetSuffix	5	Street suffix, for example: 123 E Main St. Apt 3
TrailingDirectional	3	Trailing directional, for example: 123 Pennsylvania Ave NW

Postal Data

Postal data output fields contain detailed postal information for the address, such as the preferred city name and the US carrier route. To include postal data fields in the output, set `OutputRecordType = P`.

columnName	Max. Field Length with null terminator	Description
CityPreferredName	29	The USPS® preferred city name for the ZIP Code of the address.

columnName	Max. Field Length with null terminator	Description
CityShortName	29	The USPS®-approved abbreviation for the city, if there is one. The USPS® provides abbreviations for city names that are 14 characters long or longer. City abbreviations are 13 characters or less and can be used when there is limited space on the mailing label. If there is no short city name for the city, then the full city name is returned.
CityStateRecordName	29	USPS® city state city name.
DeliveryPointCode	3	Two-digit delivery point barcode.
GovernmentBuilding	2	<p>Indicates if a building is used by the city, state, or federal government.</p> <p>A City government building</p> <p>B Federal government building</p> <p>C State government building</p> <p>D Firm only</p> <p>E City government building and firm only</p> <p>F Federal government building and firm only</p> <p>G State government building and firm only</p> <p>The values A, B, C, E, F, and G are valid for Alternate records only. The value D is valid for both base and alternate records.</p>
PostalBarCode	7	Six-digit combination of ZIP+4 Code and the delivery point barcode.
PostalCodeClass	2	<p>ZIP Classification code.</p> <p>null Standard ZIP Code</p> <p>M Military ZIP Code</p> <p>P ZIP Code has P.O. boxes only</p> <p>U Unique ZIP Code (ZIP Code assigned to a single organization)</p>

columnName	Max. Field Length with null terminator	Description
PostalCodeUnique	2	Indicates if the ZIP Code is a unique ZIP Code assigned to an individual company or agency. Y Unique ZIP name null No unique ZIP name
PostalFacility	2	USPS City State Name Facility code. A Airport Mail Facility (AMF) B Branch C Community Post Office (CPO) D Area Distribution Center (ADC) E Sectional Center Facility (SCF) F Delivery Distribution Center (DDC) G General Mail Facility (GMF) K Bulk Mail Center (BMC) M Money Order Unit N Non-Postal Community Name, Former Postal Facility, or Place Name P Post Office S Station U Urbanization
USBCCheckDigit	2	Check-digit for delivery point barcode.
USCarrierRouteCode	5	Carrier Route code.

columnName	Max. Field Length with null terminator	Description
USCarrierRouteSort	2	<p>Indicates if the USPS uses a carrier route sort, and what type of sort the USPS allows.</p> <p>A Automation cart allowed, optional cart merging allowed</p> <p>B Automation cart allowed, no optional cart merging allowed</p> <p>C No automation cart allowed, optional cart merging allowed</p> <p>D No automation cart allowed, no optional cart merging allowed</p>
USCityDelivery	2	<p>Indicates if has city-delivery carrier routes.</p> <p>Y Has city-delivery carrier routes</p> <p>N Does not have city-delivery carrier routes.</p>
USLACS	2	<p>Indicates if LACS^{Link} match occurred.</p> <p>Y Matched LACS^{Link} record</p> <p>N LACS^{Link} match not found</p> <p>F False-positive LACS^{Link} record</p> <p>S Secondary information (unit number) removed to make a LACS^{Link} match</p> <p>null Records not processed through LACS^{Link}</p> <p>For more information, see Locatable Address Conversion System (LACS) on page 180.</p>
USLACS.ReturnCode	3	<p>Indicates LACS^{Link} results.</p> <p>A Matched LACS^{Link} record</p> <p>00 LACS^{Link} match was not found</p> <p>09 Matched to highrise default, but noLACS^{Link} conversion</p> <p>14 Found LACS^{Link} match, but no LACS^{Link} conversion</p> <p>92 Secondary information (unit number) was removed to make a LACS^{Link} match</p> <p>null Records not processed through LACS^{Link}</p> <p>For more information, see Locatable Address Conversion System (LACS) on page 180.</p>

columnName	Max. Field Length with null terminator	Description
USLOTCode	2	A combination of the 4-digit Line of Travel (LOT) Code and the ascending (A) or descending (D) indicator.

Qualifiers

The qualifiers output fields contain qualification information about the match, such as the location code and the match code. To include qualifier output fields in the output, set `OutputRecordType = Q`.

columnName	Max. Field Length with null terminator	Description
CountryLevel	2	The category of postal data available. Always returns A in ReverseAPNLookup—Validates, corrects, and provides missing postal code, city name, state/county name, street address elements, and country name.
DatabaseVersion	15	USPS publish date, in the format Month Year.
EWSMatch	2	Indicates if ReverseAPNLookup denied a match because of Early Warning System (EWS) data. Y EWS denied a match. null EWS did not deny a match. For more information about EWS, see Early Warning System (EWS) on page 181.
ExpirationDate	11	Date the database expires, in the format MM/DD/YYYY.
GeoStanMatchScore	13	Record matching score (for multimatches only).

columnName	Max. Field Length with null terminator	Description
Intersection	2	<p>Indicates if ReverseAPNLookup found a cross-street match.</p> <p>T True, a cross-street match was found.</p> <p>F False, a cross-street match was not found.</p>
IsAlias	4	<p>ReverseAPNLookup located a matched record by an index alias. Returns 3 characters. The first is an N for normal street match or A for alias match (including buildings, aliases, firms, etc.). The next 2 characters are:</p> <p>01 Basic index (normal address match)</p> <p>02 USPS street name alias index</p> <p>03 USPS building index</p> <p>04 USPS firm name index</p> <p>05 Statewide intersection alias match (when using the Usw.gsi or Use.gsi file)</p> <p>06 Spatial data street name alias (when using the Us_pw.gsi, Us_pe.gsi, Us_psw.gsi, or Us_pse.gsi file)</p> <p>07 Alternate index (when using Zip9.gsu, Zip9e.gsu, and Zip9w.gsu)</p> <p>08 LACS^{Link}</p> <p>09 Auxiliary file match</p> <p>10 Centrus Alias index (when using usca.gsi)</p> <p>11 POI index (when using poi.gsi)</p> <p>12 USPS Preferred Alias</p> <p>13 ZIPMove match (when using us.gsz)</p> <p>14 Expanded Centroids match (when using us_cent.gsc and/or bldgcent.gsc)</p>
LACSAddress	2	<p>Indicates if ReverseAPNLookup converted an address due to the Locatable Address Conversion System (LACS).</p> <p>L Converted</p> <p>null Not converted</p> <p>For more information about LACS, see Locatable Address Conversion System (LACS) on page 180.</p>

columnName	Max. Field Length with null terminator	Description						
LocationCode.Description	128	LocationCode converted to text. Only returned when you set the configuration options to return additional descriptions (verbose).						
MatchCode.Description	128	MatchCode converted to text. Only returned when you set the configuration options to return additional descriptions (verbose).						
RecordType	18	Indicates the record type: <ul style="list-style-type: none"> • GeneralDelivery • HighRise • FirmRecord • Normal • PostOfficeBox • RRHighwayContract 						
RecordType.Default	2	Indicates type of match that occurred for the record type HighRise or RRHighwayContract: <table border="0" style="margin-left: 20px;"> <tr> <td>Y</td> <td>Default match</td> </tr> <tr> <td>N</td> <td>Exact match</td> </tr> <tr> <td>U</td> <td>Not matched</td> </tr> </table>	Y	Default match	N	Exact match	U	Not matched
Y	Default match							
N	Exact match							
U	Not matched							

columnName	Max. Field Length with null terminator	Description
StreetDataCode	3	Indicates the data used to obtain a match. <ul style="list-style-type: none"> 0 USPS data. 1 TIGER data. 2 TomTom data. 6 HERE data. 7 TomTom point-level data. 8 Centrus point-level data. 9 Auxiliary file data. 10 User Dictionary. 11 HERE point-level data. 12 Master Location data.

For more information about these databases, see [Enterprise Geocoding Databases](#) on page 173.

Range

The range output fields contain information about the street range, such as the high and low unit numbers. To include range data fields in the output, set `OutputRecordType = R`.

columnName	Max. Field Length with null terminator	Description
Alternate	2	USPS code that specifies whether a record is a base or alternate record. <ul style="list-style-type: none"> B Base record. Base records can represent a range of addresses or an individual address, such as a firm record. A Alternate record. Alternate records are individual delivery points.
HouseNumberHigh	12	House number high.

columnName	Max. Field Length with null terminator	Description
HouseNumberLow	12	House number low.
HouseNumberParity	2	Indicates if the house number range contains even or odd numbers. E Even O Odd B Both
PostalCodeExtensionHigh	5	4-digit ZIP Code extension high.
PostalCodeExtensionLow	5	4-digit Zip Code extension low.
UnitNumberHigh	12	Unit number high.
UnitNumberLow	12	Unit number low.
UnitNumberParity	2	Indicates if the unit number range contains even or odd numbers. E Even O Odd B Both

Segment

The segment output fields contain information about the street segment identified by the data provider. To include segment data fields in the output, set `OutputRecordType = S`.

columnName	Max. Field Length with null terminator	Description
BlockLeft	16	Provides the Census FIPS Code that indicates the address is on the left side of the street.
BlockRight	16	Provides the Census FIPS Code that indicates the address is on the right side of the street.
BlockSuffixLeft	2	Current left Block suffix for Census 2010 Geography. Returns A or B. Only available in Centrus Enhanced data.
BlockSuffixRight	2	Current right Block suffix for Census 2010 Geography. Returns A or B. Only available in Centrus Enhanced data.
RoadClass	3	The type of road: 1 The road is a major road. 2 The road is a minor road.
PointCode	11	Unique point ID assigned by the data provider. This field is blank if the matched record is not from point-level data.
SegmentCode	11	Unique 10-digit segment ID assigned by the street network provider.
SegmentDirection	2	Indicates the order of numbers on a segment. F Forward R Reversed B Both U Undetermined
SegmentHouseNumberHigh	12	A high range number in the segment.
SegmentHouseNumberLow	12	A low range number in the segment.

columnName	Max. Field Length with null terminator	Description
SegmentLength		The length, in feet, of a block segment. <i>This field is deprecated.</i>
SegmentParity	2	Indicates which side of the street has odd numbers. L Left side of the street R Right side of the street B Both sides of the street U Undetermined

Reverse Geocode Address Global

For information on using the API to access Reverse Geocode Address Global, see the geocoding guides.

ReverseGeocodeUSLocation

ReverseGeocodeUSLocation takes a latitude and longitude point as input and returns the address that is the best match for that point.

ReverseGeocodeUSLocation is part of the Enterprise Geocoding Module.

ReverseGeocodeUSLocation

ReverseGeocodeUSLocation takes a latitude and longitude point as input and returns the address that is the best match for that point. For example, you could enter the following information:

Longitude: -105239771 Latitude: 40018912 Search Distance: 150 feet

This input would result in the following output:

```
4750 WALNUT ST BOULDER, CO 80301-2538
MatchCode = NS0
LocCode = AS0
Lon = -105239773
Lat = 40018911
Distances:
```

```
Search = 150
Offset = 50
Squeeze = 50
Nearest = 50.0
Pct Geocode = 94.0
SegID = 472881795
PtID = GDT
Block = 080130122032066
County Name = BOULDER COUNTY
DPBC = 50
```

Note: The address returned is an approximate address based on the latitude and longitude provided. This approximate address may not exist or may not accept mail delivery.

ReverseGeocodeUSLocation processes geocodes in the following order:

1. ReverseGeocodeUSLocation defines a small rectangle based on your input geocode and search distance.
2. ReverseGeocodeUSLocation computes the distance between each street segment and the input location.
3. If one segment is closest, ReverseGeocodeUSLocation finds the offset and interpolated percentage (using the squeeze factor) and the street side. It then computes an approximate house number based on this information.

If there is more than one segment that is equally close to the input location, a multi-match occurs. ReverseGeocodeUSLocation returns the information for all of the equally close segments so that you can determine which segment is applicable.

4. ReverseGeocodeUSLocation returns the address information, including the segment range, the approximate house number, and the parity of the range along with other standard address information.

Note: Although many of the standard address matching outputs apply to the reverse geocoding option, several outputs are unavailable (such as LACS^{Link} information and unit numbers). ReverseGeocodeUSLocation returns these outputs as blank.

ReverseGeocodeUSLocation also has outputs specific to reverse geocode processing, such as specific match codes and the distance from the input location to the matched segment.

To use ReverseGeocodeUSLocation, you need additional data files, called GSX files. There is an option to install these files when you install the geocoding database. The GSX files must be installed the GSX subdirectory of the geocoding database. If you install the Centrus Enhanced Points, Centrus Premium Points, or TomTom Points database, you must recreate the GSX files. Consult with Pitney Bowes Software Technical Support if you need more information about GSX files.

Input

ReverseGeocodeUSLocation Input Data

ReverseGeocodeUSLocation takes longitude and latitude information as input. The following table provides information about the format and layout of the input.

columnName	Format	Description
Latitude	String	Latitude of the point for which you want address information returned. Specify latitude in millionths of decimal degrees.
Longitude	String	Longitude of the point for which you want address information returned. Specify longitude in millionths of decimal degrees.

Options

Configuration Options

ReverseGeocodeUSLocation Configuration Options

The following table lists the configuration options for ReverseGeocodeUSLocation.

optionName	Description
Dataset	The name of the database that contains the data to use in the search process.
SearchDistance	Specifies the radius, in feet, that ReverseGeocodeUSLocation searches for matches. The allowable range is 0 - 5280 feet. Default = 150 feet.
FindClosestPoint	<p>Enables matching to the nearest point address within the search radius, rather than to the closest feature - such as a street segment or intersection as well as point addresses.</p> <p>Note: This option requires that at least one streets data set and one points data set are loaded; otherwise, the match will be made to the closest feature.</p> <p>Y Match to the nearest point address within the search radius.</p> <p>N Match to the closest point address or feature. Default.</p>

optionName	Description
FindNearestAddress	<p>Specifies whether ReverseGeocodeUSLocation should find the nearest interpolated address to the input geocode.</p> <p>Y Find the nearest address. Default.</p> <p>N Do not find the nearest address.</p> <p>Note: You can use this option with the <code>FindNearestIntersection</code> option to geocode to both addresses and intersections.</p>
FindNearestUnranged	<p>Specifies whether ReverseGeocodeUSLocation can match to a street segment that does not have a number range. This option is active when <code>FindNearestAddress=Y</code>.</p> <p>Y Allow ReverseGeocodeUSLocation to match to an unranged street segment. Default.</p> <p>N Do not allow ReverseGeocodeUSLocation to match to an unranged street segment.</p> <p>Note: If you are using the point-level data option, ReverseGeocodeUSLocation ignores the Nearest Unranged option.</p>
FindNearestIntersection	<p>Specifies whether ReverseGeocodeUSLocation should find the nearest street intersection to the input geocode.</p> <p>Y Find the nearest street intersection. Default.</p> <p>N Do not find the nearest street intersection.</p> <p>Note: You can use this option with the <code>FindNearestAddress</code> option to geocode to both addresses and intersections.</p>

optionName

Description

Offset

Specifies the offset distance from the street segments. The allowable range is 0 - 5280 feet. Default = 50 feet.

The offset distance is used in street-level geocoding to prevent the geocode from being in the middle of a street. It compensates for the fact that street-level geocoding returns a latitude and longitude point in the center of the street where the address is located. Since the building represented by an address is not on the street itself, you do not want the geocode for an address to be a point on the street. Instead, you want the geocode to represent the location of the building which sits next to the street. For example, an offset of 40 feet means that the geocode will represent a point 40 feet back from the center of the street. The distance is calculated perpendicular to the portion of the street segment for the address. Offset is also used to prevent addresses across the street from each other from being given the same point. The diagram below shows an offset point in relation to the original point.

Street coordinates are accurate to 1/10,000th of a degree and interpolated points are accurate to 1/1,000,000th of a degree.

Squeeze

Specifies the distance, in feet, to squeeze the street end points in street-level geocoding. The range is 0 -2147483647 feet. Default = 50 feet. The following diagram compares the end points of a street to squeezed end points.

LatLonFormat

Specifies the format to use for returned latitude/longitude.

- Decimal** The format is 90.000000-180.000000. Default.
- Integer** The format is 90000000-180000000.

optionName	Description
InputLatLonFormat	<p>Specifies the format to use for input latitude/longitude.</p> <p>Decimal The format is 90.000000-180.000000.</p> <p>Integer The format is 90000000-180000000. Default.</p>
RetrieveElevation	<p>Specifies whether ReverseGeocodeUSLocation returns the elevation of the address. Elevation is the distance above or below sea level of a given location. The elevation is returned in the Elevation output field, which is part of the Latitude/Longitude output group.</p> <p>Note: This option requires that you have licensed and installed the Centrus Premium Points database. Elevation data is not available for all addresses. See the coverage map included with the points database.</p> <p>Y Return elevation data.</p> <p>N Do not return elevation data. Default.</p>
RetrieveAPN	<p>Specifies whether ReverseGeocodeUSLocation should determine the address's APN (assessor's parcel number). The APN is an ID number assigned to a property by the local property tax authority. The APN is returned in the APN output field, which is part of the Census output group.</p> <p>Note: This option requires that you have licensed and installed the Cenrus Enhanced Points or Centrus Premium Points database. APN data is not available for all addresses. See the coverage map included with the points database.</p> <p>Y Return APN data.</p> <p>N Do not return APN data. Default.</p>

optionName	Description
FIND_APPROXIMATE_PBKEY	<p>When FIND_APPROXIMATE_PBKEY is enabled, if an address match is not made to Master Location Data (MLD), but to a different dataset, the pbKey™ unique identifier of the nearest MLD point located within the search distance is returned. To distinguish when a fallback pbKey™ unique identifier is returned, the PBKEY return value contains a leading character of "X" rather than "P", for example: X00001XSF1IF. Note, all of the other fields returned for the address match, including the geocode and all associated data, reflect the match results for the input address. The fallback pbKey™ unique identifier can then be used for the lookup to the GeoEnrichment dataset(s), and the attribute data for the fallback location is returned for the match.</p> <p>For more information, see PBKey Fallback.</p> <p>Note: This option requires that you have licensed and installed the Master Location Dataset.</p> <p>The search distance for the nearest MLD point is configurable using the ReverseGeocodeUSLocation SearchDistance field. The allowable range is 0 - 5280 feet. Default = 150 feet.</p> <p>Y When a matched address does not have an associated pbKey™ unique identifier, attempt to return the nearest address record's pbKey™ unique identifier.</p> <p>N When a matched address does not have an associated pbKey™ unique identifier, do not return the nearest address record's pbKey™ unique identifier. Default.</p>

Output Format

ReverseGeocodeUSLocation Output Format Options

The following table lists the options that control the format of the output.

optionName	Description
OutputCasing	<p>Specifies the casing of the output data.</p> <p>M Returns the output in mixed case. Default. For example:</p> <p>123 Main St Mytown FL 12345</p> <p>U Returns the output in upper case. For example:</p> <p>123 MAIN ST MYTOWN FL 12345</p>

optionName	Description
OutputVerbose	<p>Specifies whether ReverseGeocodeUSLocation provides an additional description field as output. This field provides the text equivalent to a field represented by a code. For example, <code>LocationCode</code> returns a code that indicates the accuracy (quality) of the assigned geocode. <code>LocationCode.Description</code> provides the description for the code returned.</p> <p>Y Include verbose fields.</p> <p>N Do not include verbose fields. Default.</p>

Output Data

ReverseGeocodeUSLocation Output Data Options

The following table lists the options that control which data is returned by ReverseGeocodeUSLocation.

optionName	Description
OutputRecordType	<p>Specifies the optional data to include in the output. Note that ReverseGeocodeUSLocation always returns the data listed in Default Output on page 315. The data you select here is returned with the default output data.</p> <ul style="list-style-type: none"> • C—Census • E—Parsed Elements • L—Latitude/Longitude • R—Range • S—Segment • Q—Qualifiers <p>For a list of the fields included in each data type, see Output on page 313.</p> <p>If you do not want all of the fields in a record type returned, do not use <code>OutputRecordType</code>; instead, use <code>OutputFields</code> to specify the desired individual output fields.</p>
OutputFields	<p>Specifies the individual output fields you want returned. List fields with a pipe () between each field. You can use this field instead of the Output Record Type to limit the output to those fields that are important to your data needs.</p> <p>Default list: <code>AddressLine1 LastLine Longitude Latitude MatchCode LocationCode</code></p>

Output

ReverseGeocodeUSLocation always returns a default set of output fields that contain the address, geocode, and result indicators. For information about these fields, see [Default Output](#) on page 315. You can also choose to include optional categories of output data.

Census

Census output fields contain U.S. Census information about the address. To include census data in the output, set `OutputRecordType = C`.

Note: The following Census output fields - `CBSADivisionName`, `CBSAName`, `CSAName` and `USCountyName` - are only returned when you set the option `OutputVerbose=Y`.

columnName	Max. Field Length with null terminator	Description
APN	46	The assessor's parcel number of the property. The assessor's parcel number is an ID number assigned to a property by the local property tax authority.
BlockSuffix	2	Single character block suffix for split Census blocks. Returns A or B. Only available in Centrus Enhanced data.
CBSACode	6	Indicates Core Based Statistical Area (CBSA).
CBSADivisionCode	6	Denotes a subdivision of a CBSA.
CBSADivisionName	128	<p>The name of the Core Based Statistical Area (CBSA) division in which the address is located.</p> <p>A CBSA division is a metropolitan statistical area with a population of at least 2.5 million that has been subdivided to form smaller groupings of counties referred to as "metropolitan divisions." For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website:</p> <p>www.census.gov/population/www/metroareas/metroarea.html</p> <p>Note: The CBSA division name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>

columnName	Max. Field Length with null terminator	Description
CBSAMetro	2	<p>Metropolitan Statistical Area. Valid values include:</p> <p>Y Metro statistical area.</p> <p>N Micro statistical area.</p> <p>null Data unavailable.</p>
CBSAName	128	<p>The name of the core based statistical area (CBSA) in which the address is located.</p> <p>A CBSA is a collective term that refers to both metropolitan and micropolitan areas. A metropolitan area has a population of more than 50,000, and a micropolitan area has a population between 10,000 and 49,999. For more information, see <i>Metropolitan and Micropolitan Statistical Areas</i> section of the U.S. Census Bureau website:</p> <p>www.census.gov/population/www/metroareas/metroarea.html</p> <p>Note: The CBSA name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
CensusBlockID	16	The ID of the Census Federal Information Processing Standard (FIPS) code.
CensusTract	7	6-digits extracted from the CensusBlockID.
CSACode	4	Denotes the code for a geographic entity that consists of 2 or more adjacent CBSAs with employment interchange measures of at least 15.

columnName	Max. Field Length with null terminator	Description
CSAName	128	<p>The name of the combined statistical area (CSA) in which the address is located.</p> <p>A CSA is a combination of two or more adjacent Core Based Statistical Areas (CBSAs) with a high employment interchange measure. The employment interchange measure is the sum of the percentage of employed residents of the smaller entity who work in the larger entity and the percentage of the employment in the smaller entity that is accounted for by workers who reside in the larger entity. Pairs of CBSAs with employment interchange measures of at least 25% combine automatically. Pairs of CBSAs with employment interchange measures of at least 15%, but less than 25%, may combine if local opinion in both areas favors combination.</p> <p>Note: The CSA name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
USCountyName	128	<p>The name of the county or parish in which the address is located.</p> <p>Note: The county/parish name is only returned if you set the option <code>OutputVerbose=Y</code>.</p>
USFIPSCountyNumber	4	3-digit FIPS county code extracted from the CensusBlockID.
USFIPSStateCode	3	2-digit FIPS state code extracted from the CensusBlockID.
USFIPSStateCountyCode	6	5-digit FIPS code for state and county extracted from the CensusBlockID.

Default Output

ReverseGeocodeUSAddress always includes the following fields in the output.

columnName	Max. Field Length with null terminator	Description
AdditionalInputData	61	This field may contain input data that was not used for matching; for example, input address information that appears after a mail stop or attention designator.
AddressLine1	104	First line of the address.
AddressLine2	104	Second line of the address.
City	29	Municipality name.
Confidence	4	Indicates the confidence in the output provided. The range is from 0 (zero) to 100, with 0 being no match and 100 being an exact match.
Country	25	The name of the country. Since ReverseAPNLookup only works for U.S. locations, this field will always contain United States of America .
Distance	8	The distance, in feet, from the input geocode to nearest matched address or intersection.
Elevation	11	The location's elevation in feet above or below sea level.
FirmName	41	Name of the company.
LastLine	61	Complete last address line (municipality, state, and postal code).
Latitude	11	7-digit number in degrees and calculated to 4 decimal places (in the format specified).
LocationCode	5	Indicate the accuracy (quality) of the assigned geocode. For more information, see Address Location Codes on page 346.

columnName	Max. Field Length with null terminator	Description
Longitude	12	7-digit number in degrees and calculated to 4 decimal places (in the format specified).
MatchCode	5	Indicates the portions of the address that matched to the directory file. For more information, see Match Codes on page 338.
PBKey	13	A unique address identifier that is returned when an address match is made using the Master Location Dataset. The pbKey™ unique identifier is used as a lookup key to a GeoEnrichment dataset, in order to return attribute data for the match.
PercentGeocode	6	The percent along the street segment that matches the geocode. For example, if the returned geocode falls 1/3 along the way of the entire street segment, the percent is 33.000. Note: This value is always 0.0 for matches to point-level data and intersections.
PostalCode	10	9-digit ZIP Code with or without a hyphen.
PostalCode.AddOn	5	4-digit ZIP Code extension.
PostalCode.Base	6	5-digit ZIP Code.
ProcessedBy	4	The underlying software that processed the request. KGR for ReverseGeocodeUSLocation.
RRHC	2	Rural Route Highway Contract (RRHC). This field is null if the address not a RRHC.
StateProvince	3	2-character state abbreviation.

columnName	Max. Field Length with null terminator	Description
Status	2	Reports the success or failure of the match attempt. null Success F Failure
Status.Code	23	Reason for failure: <ul style="list-style-type: none"> • Internal System Error • No Geocode Found • Insufficient Input Data
Status.Description	32	Description of the problem: <p>Problem + explanation Returned when <code>Status.Code</code> contains "Internal System Error"</p> <p>Geocoding Failed Returned when <code>Status.Code</code> contains "No Geocode Found"</p> <p>No location returned Returned when <code>Status.Code</code> contains "No Geocode Found"</p>
StreetDataType	20	The data set that ReverseGeocodeUSLocation attempted to match against. <p>USPS USPS</p> <p>TIGER TIGER</p> <p>TOMTOM TomTom Streets data set</p> <p>SANBORN POINT DATA Sanborn Points data set</p> <p>HERE HERE Streets data set</p> <p>TOMTOM POINT DATA TomTom Points data set</p> <p>AUXILIARY Auxiliary file</p> <p>CENTRUS POINT DATA Centrus Points data set</p> <p>USER DICTIONARY User Dictionary</p> <p>HERE POINT DATA HERE Points data set</p> <p>MASTER LOCATION Master Location Data</p>

columnName	Max. Field Length with null terminator	Description
StreetSide	2	Indicates the side of the street the range occupies. L The range occupies the left side of the street. R The range occupies the right side of the street. B The range occupies both sides of the street. U Undetermined.
USUrbanName	31	Urbanization name. Puerto Rico addresses only.

Latitude/Longitude

The latitude/longitude output fields contain the geographic coordinates of the location. To include latitude/longitude output fields in the output, set `OutputRecordType = L`.

columnName	Max. Field Length with null terminator	Description
Elevation	11	The location's elevation in feet above or below sea level.
Latitude	11	7-digit number in degrees and calculated to 4 decimal places (in the format specified).
Longitude	12	7-digit number in degrees and calculated to 4 decimal places (in the format specified).

Parsed Elements

The Parsed Elements output record type contains standard address information as individual units, such as street suffixes (AVE) and leading directionals (N and SE). To include parsed elements in the output, set `OutputRecordType = E`.

columnName	Max. Field Length with null terminator	Description
ApartmentLabel	5	Unit, such as apartment, suite, or lot.
ApartmentLabel2	5	Unit, such as apartment, suite, or lot.
ApartmentNumber	12	Unit number.
ApartmentNumber2	12	Unit number.
CrossStreetLeadingDirectional	3	Prefix for cross street.
CrossStreetName	41	Name of cross street.
CrossStreetSuffix	5	Cross street suffix.
CrossStreetTrailingDirectional	3	Postfix for cross street.
HouseNumber	12	Building number for the matched location. Note: This is an approximate building number based on the latitude and longitude provided. This approximate address may not exist or may not accept mail delivery.
LeadingDirectional	3	Street directional that precedes the street name. For example, the N in 138 N Main Street.
PrivateMailbox	9	Private mailbox. Not output for multiline input.
PrivateMailbox.Designator	5	Private mailbox description. Not output for multiline input.

columnName	Max. Field Length with null terminator	Description
StreetName	41	Street name.
StreetSuffix	5	The street type of the matched location. For example, AVE for Avenue.
TrailingDirectional	3	Street directional that follows the street name. For example, the N in 456 Washington N.

Postal Data

Postal data output fields contain detailed postal information for the address, such as the preferred city name and the US carrier route. To include postal data fields in the output, set `OutputRecordType = P`.

columnName	Max. Field Length with null terminator	Description
CityPreferredName	29	The USPS® preferred city name for the ZIP Code of the address.
CityShortName	29	The USPS®-approved abbreviation for the city, if there is one. The USPS® provides abbreviations for city names that are 14 characters long or longer. City abbreviations are 13 characters or less and can be used when there is limited space on the mailing label. If there is no short city name for the city, then the full city name is returned.
CityStateRecordName	29	USPS® city state city name.
DeliveryPointCode	3	Two-digit delivery point barcode.

columnName	Max. Field Length with null terminator	Description
GovernmentBuilding	2	<p>Indicates if a building is used by the city, state, or federal government.</p> <p>A City government building</p> <p>B Federal government building</p> <p>C State government building</p> <p>D Firm only</p> <p>E City government building and firm only</p> <p>F Federal government building and firm only</p> <p>G State government building and firm only</p> <p>The values A, B, C, E, F, and G are valid for Alternate records only. The value D is valid for both base and alternate records.</p>
PostalBarCode	7	Six-digit combination of ZIP+4 Code and the delivery point barcode.
PostalCodeClass	2	<p>ZIP Classification code.</p> <p>null Standard ZIP Code</p> <p>M Military ZIP Code</p> <p>P ZIP Code has P.O. boxes only</p> <p>U Unique ZIP Code (ZIP Code assigned to a single organization)</p>
PostalCodeUnique	2	<p>Indicates if the ZIP Code is a unique ZIP Code assigned to an individual company or agency.</p> <p>Y Unique ZIP name</p> <p>null No unique ZIP name</p>

columnName	Max. Field Length with null terminator	Description
PostalFacility	2	USPS City State Name Facility code. A Airport Mail Facility (AMF) B Branch C Community Post Office (CPO) D Area Distribution Center (ADC) E Sectional Center Facility (SCF) F Delivery Distribution Center (DDC) G General Mail Facility (GMF) K Bulk Mail Center (BMC) M Money Order Unit N Non-Postal Community Name, Former Postal Facility, or Place Name P Post Office S Station U Urbanization
USBCCheckDigit	2	Check-digit for delivery point barcode.
USCarrierRouteCode	5	Carrier Route code.
USCarrierRouteSort	2	Indicates if the USPS uses a carrier route sort, and what type of sort the USPS allows. A Automation cart allowed, optional cart merging allowed B Automation cart allowed, no optional cart merging allowed C No automation cart allowed, optional cart merging allowed D No automation cart allowed, no optional cart merging allowed
USCityDelivery	2	Indicates if has city-delivery carrier routes. Y Has city-delivery carrier routes N Does not have city-delivery carrier routes.

columnName	Max. Field Length with null terminator	Description
USLACS	2	<p>Indicates if LACS^{Link} match occurred.</p> <p>Y Matched LACS^{Link} record</p> <p>N LACS^{Link} match not found</p> <p>F False-positive LACS^{Link} record</p> <p>S Secondary information (unit number) removed to make a LACS^{Link} match</p> <p>null Records not processed through LACS^{Link}</p> <p>For more information, see Locatable Address Conversion System (LACS) on page 180.</p>
USLACS.ReturnCode	3	<p>Indicates LACS^{Link} results.</p> <p>A Matched LACS^{Link} record</p> <p>00 LACS^{Link} match was not found</p> <p>09 Matched to highrise default, but noLACS^{Link} conversion</p> <p>14 Found LACS^{Link} match, but no LACS^{Link} conversion</p> <p>92 Secondary information (unit number) was removed to make a LACS^{Link} match</p> <p>null Records not processed through LACS^{Link}</p> <p>For more information, see Locatable Address Conversion System (LACS) on page 180.</p>
USLOTCode	2	A combination of the 4-digit Line of Travel (LOT) Code and the ascending (A) or descending (D) indicator.

Qualifiers

The qualifiers output record type contains qualification information about the match, such as the location code and the match code. To include latitude/longitude output fields in the output, set `OutputRecordType = Q`.

columnName	Max. Field Length with null terminator	Description
CountryLevel	2	The category of postal data available. Always returns A in ReverseGeocodeUSLocation—Validates, corrects, and provides missing postal code, city name, state/county name, street address elements, and country name.
DatabaseVersion	15	USPS publish date, in the format Month Year.
EWSMatch	2	Indicates if ReverseGeocodeUSLocation denied a match because of Early Warning System (EWS) data. Y EWS denied a match. null EWS did not deny a match. For more information about EWS, see Early Warning System (EWS) on page 181.
ExpirationDate	11	Date the database expires, in the format MM/DD/YYYY.
GeoStanMatchScore	13	Record matching score (for multimatches only).
Intersection	2	Indicates if ReverseGeocodeUSLocation found a cross-street match. T True, a cross-street match was found. F False, a cross-street match was not found.

columnName	Max. Field Length with null terminator	Description
IsAlias	4	<p>ReverseGeocodeUSLocation located a matched record by an index alias. Returns 3 characters. The first is an N for normal street match or A for alias match (including buildings, aliases and firms). The next 2 characters are:</p> <p>01 Basic index (normal address match)</p> <p>02 USPS street name alias index</p> <p>03 USPS building index</p> <p>04 USPS firm name index</p> <p>05 Statewide intersection alias match (when using the Usw.gsi or Use.gsi file)</p> <p>06 Spatial data street name alias (when using, the Us_pw.gsi, Us_pe.gsi, Us_psw.gsi, or Us_pse.gsi file is required)</p> <p>07 Alternate index (when using the Zip9.gsu, Zip9e.gsu, and Zip9w.gsu files)</p> <p>08 LACS^{Link}</p> <p>09 Auxiliary file match</p> <p>10 Centrus Alias index (when using the usca.gsi file)</p> <p>11 POI index (when using poi.gsi)</p> <p>12 USPS Preferred Alias</p> <p>13 ZIPMove match (when using us.gsz)</p> <p>14 Expanded Centroids match (when using us_cent.gsc and/or bldgcent.gsc)</p>
LACSAddress	2	<p>Indicates if ReverseGeocodeUSLocation converted an address due to the Locatable Address Conversion System (LACS).</p> <p>L Converted</p> <p>null Not converted.</p> <p>For more information about LACS, see Locatable Address Conversion System (LACS) on page 180.</p>
LocationCode.Description	128	LocationCode converted to text. Only returned when you set the configuration options to return additional descriptions (verbose).

columnName	Max. Field Length with null terminator	Description
MatchCode.Description	128	MatchCode converted to text. Only returned when you set the configuration options to return additional descriptions (verbose).
RecordType	18	Indicates the record type: <ul style="list-style-type: none"> • GeneralDelivery • HighRise • FirmRecord • Normal • PostOfficeBox • RRHighwayContract
RecordType.Default	2	Indicates type of match that occurred for the record type HighRise or RRHighwayContract: <p>Y Default match.</p> <p>N Exact match.</p> <p>U Not matched.</p>
StreetDataCode	3	Indicates the data used to obtain a match. <p>0 USPS data.</p> <p>1 TIGER data.</p> <p>2 TomTom data.</p> <p>6 HERE data.</p> <p>7 TomTom point-level data.</p> <p>8 Centrus point-level data.</p> <p>9 Auxiliary file data.</p> <p>10 User Dictionary.</p> <p>11 HERE point-level data.</p> <p>12 Master Location data.</p> <p>For more information about these databases, see Enterprise Geocoding Databases on page 173.</p>
StreetDataType	20	Indicates the data first used to attempt a match.

Range

The range output record type contains information about the street range, such as the high and low unit numbers. To include range data fields in the output, set `OutputRecordType = R`.

columnName	Max. Field Length with null terminator	Description
Alternate	2	USPS code that specifies whether a record is a base or alternate record. B Base record. Base records can represent a range of addresses or an individual address, such as a firm record. A Alternate record. Alternate records are individual delivery points.
HouseNumberHigh	12	House number high.
HouseNumberLow	12	House number low.
HouseNumberParity	2	Indicates if the house number range contains even or odd numbers. E Even O Odd B Both
PostalCodeExtensionHigh	5	4-digit ZIP Code extension high.
PostalCodeExtensionLow	5	4-digit Zip Code extension low.
UnitNumberHigh	12	Unit number high.
UnitNumberLow	12	Unit number low.

columnName	Max. Field Length with null terminator	Description
UnitNumberParity	2	Indicates if the unit number range contains even or odd numbers. E Even O Odd B Both

Segment

The segment output record type contains information about the street segment identified by the data provider. To include segment data fields in the output, set `OutputRecordType = S`.

columnName	Max. Field Length with null terminator	Description
BlockLeft	16	Provides the Census FIPS Code that indicates the address is on the left side of the street.
BlockRight	16	Provides the Census FIPS Code that indicates the address is on the right side of the street.
BlockSuffixLeft	2	Current left Block suffix for Census 2010 Geography. Returns A or B. Only available in Centrus Enhanced data.
BlockSuffixRight	2	Current right Block suffix for Census 2010 Geography. Returns A or B. Only available in Centrus Enhanced data.
RoadClass	3	The type of road: 1 Major 2 Minor
SegmentCode	11	Unique 10-digit segment ID assigned by the street network provider.

columnName	Max. Field Length with null terminator	Description
SegmentDirection	2	Indicates the order of numbers on a segment. F Forward R Reversed B Both U Undetermined
SegmentHouseNumberHigh	12	A high range number in the segment.
SegmentHouseNumberLow	12	A low range number in the segment.
SegmentLength		The length, in feet, of a block segment. <i>This field is deprecated.</i>
SegmentParity	2	Indicates which side of the street has odd numbers. L Left side of the street R Right side of the street B Both sides of the street U Undetermined
SegmentPoints	1024	An array of latitude/longitude values that represent the segment coordinates to the matched segment. The segment points data that is returned for each type of match is as follows: <ul style="list-style-type: none"> • Street matches - a list of points • Point matches - one point is returned that is the same as the matched point since a point match consists of a single segment with a single range. • Intersection matches - the segment points are returned for the segment listed first in the intersection output. For example, Forest Ave at 6th returns the segment points for Forest Ave.

Geocode US Address Auxiliary Files

Auxiliary File Overview

Use auxiliary files to match against special data that is not included in the GeocodeUSAddress database.

The GeocodeUSAddress database is updated regularly to incorporate changes made by the USPS and third-party data vendors. You may have newer information that has not yet been incorporated. Auxiliary files provide a way for you to process your input records against a file that includes these changes.

Note: ReverseGeocodeUSAddress does not support auxiliary files.

There are two types of auxiliary file records:

- **Street Records**—Contains a range of one or more addresses on a street. For required fields, see [Auxiliary File Layout](#) on page 333. A street record must not have secondary address information mailstops, Private mail boxes (PMBs), and PO Boxes.
- **Landmark Records**—Represents a single site. For required fields, see [Auxiliary File Layout](#) on page 333. A landmark record must not have street type abbreviations, predirectional and postdirectional abbreviations, or low and high house numbers.

Note: You cannot update the auxiliary file while GeocodeUSAddress is running. If you want to update the auxiliary file, stop GeocodeUSAddress before attempting to replace or edit the file.

Matching to Auxiliary Files

GeocodeUSAddress matches an input address to an auxiliary file as follows:

1. GeocodeUSAddress determines if there is an auxiliary file present.

If you have an auxiliary file in the dataset directory, GeocodeUSAddress automatically loads and attempts to match to the auxiliary file. You can verify that GeocodeUSAddress found an auxiliary file by looking at the version information page in the Management Console. One of the following statuses display:

- **Loaded**—An auxiliary file is loaded
- **None**—An auxiliary file has not been found or loaded
- **Invalid**—An auxiliary file was found, but failed to successfully load

GeocodeUSAddress only accepts one auxiliary file. If more than one auxiliary files is present, GeocodeUSAddress attempts to match against the first file. GeocodeUSAddress ignores any additional auxiliary files for matching, regardless if GeocodeUSAddress found a match to the first auxiliary file.

If a record in the auxiliary files is invalid, GeocodeUSAddress returns a invalid record message. GeocodeUSAddress continues to match input addresses with the auxiliary file, but will not match to the invalid auxiliary file record.

2. If an auxiliary file is present, GeocodeUSAddress attempts to match to the auxiliary file.

GeocodeUSAddress assumes that the auxiliary file is the most accurate data set and attempts to find a match to the input address in the auxiliary file. If GeocodeUSAddress cannot find a match in the auxiliary file, it matches the input address with the other Enterprise Geocoding Module databases.

Note: GeocodeUSAddress only matches input address lists to auxiliary files if there is an exact match. Your input address list should be free of misspellings and incomplete addresses.

3. If GeocodeUSAddress finds an exact record match to the auxiliary file, it standardizes the match to USPS regulations and returns the output of the auxiliary file match.

GeocodeUSAddress uses the following defaults if you do not include the values in the auxiliary file:

- House number parity = B (both odds and evens)
- Segment direction = A (ascending)
- Side of street = U (unknown)

Record Type Matching Rules

When matching against an auxiliary file, GeocodeUSAddress uses the following rules:

Street record match

- The input house number must fall within or be equal to the low and high house number values of the auxiliary record.
- The input house number must agree with the parity of the auxiliary record.
- The input ZIP Code must exactly match the ZIP Code of the auxiliary record.

Landmark record match

- The input data must contain a ZIP Code and address line, and the values must exactly match the values on the auxiliary record.
- The input address cannot have any other data, such as a house number, unit number, or Private Mail Box (PMB).

Note: GeocodeUSAddress only matches the ZIP Code against the auxiliary file. GeocodeUSAddress does not verify that the ZIP Code of the input address record is correct for the city and state. Validate this information in your input lists before processing against the auxiliary file.

Unavailable Features and Functions

The following features and functions do not apply when GeocodeUSAddress makes an auxiliary file match.

- GeocodeUSAddress does not match to
 - two-line addresses
 - multi-line addresses
 - intersection addresses
 - dual addresses
- GeocodeUSAddress does not perform EWS, ZIPMove, LACSLink, or DPV processing on auxiliary matches
- You can only access the auxiliary file with processing through the Find function. You cannot access the auxiliary file through the Find First/Next or MBR functions
- You can only access the auxiliary file logic using the address code option of the Find function, not the geocode option.

Auxiliary Match Output

GeocodeUSAddress provides special data type, match codes, and location code values for auxiliary matches. When GeocodeUSAddress finds a match to an auxiliary file, the default output follows these conventions:

- GeocodeUSAddress formats the auxiliary file match as a street-style address for output. This excludes PO Boxes, Rural Routes, General Delivery, etc.
- GeocodeUSAddress follows the case setting you indicate (by default, upper case) by the casing function. GeocodeUSAddress does not maintain the casing in the auxiliary file for mixed casing values. For example, GeocodeUSAddress returns O'Donnell as O'DONNELL or Odonnell depending on the setting of the casing function.

Note: GeocodeUSAddress does not change the casing for the User Data field.

- GeocodeUSAddress removes spaces at the beginning and ending of fields in the auxiliary file.

Note: GeocodeUSAddress does not remove spaces for the User Data field.

Auxiliary File Layout

You must comply with the following organizational rules when you create auxiliary file:

- Files are fixed-width text files with a `.gax` extension
- Files can contain up to 500,000 records.
- Use semicolons in the first column to indicate a row is a comment, not a data record; GeocodeUSAddress ignores rows that begin with a semicolon.
- For optimal performance, order the records within the file by descending ZIP Code, and then descending street name.

- Records must represent only one side of a street. To represent both sides of a street, create a record for each side of the street.
- Records must represent segments that are straight lines.
- House numbers must follow USPS rules documented in Publication 28.
- Numeric fields, such as ZIP Codes, must contain only numbers.
- If house numbers are present in the record, the house number range must be valid according to USPS rules documented in Publication 28, Appendix E.
- Latitude and Longitude values must be in millionths of decimal degrees.
- Records cannot contain PO Box addresses.

The following table shows auxiliary file layout.

Field	Description	Required	Required for Street Segment Match	Required for Landmark Match	Exact Match Required if Present	Length	Position
ZIP Code	5-digit ZIP Code.	X	X	X	X	5	1-5
Street name	Name of the street or landmark.	X	X	X	X	30	6-35
Street type abbreviation	Street type. Also called street suffix. See the USPS Publication 28, Appendix C for a complete list of supported street types.				X	4	36-39
Predirectional	USPS street name predirectional abbreviation. Supported values are N, E, S, W, NE, NW, SE, and SW.				X	2	40-41
Postdirectional	USPS street name postdirectional abbreviations. Supported values are N, E, S, W, NE, NW, SE, and SW.				X	2	42-43

Field	Description	Required	Required for Street Segment Match	Required for Landmark Match	Exact Match Required if Present	Length	Position
RESERVED	RESERVED					4	44-47
Low house number	Low house number of the address range.	X	X			11	48-58
High house number	High house number of the address range.	X	X			11	59-69
House number parity	Indicates the parity of the house number in the range. E - Even O - Odd B - Both					1	70
Segment direction	Direction the house numbers progress along the segment: F - Forward (default) R - Reverse					1	71
RESERVED	RESERVED					1	72
FIPS state	US government FIPS state code.					2	73-74
FIPS county	US government FIPS county code.					3	75-77
Census tract	US Census tract number.					6	78-83

Field	Description	Required	Required for Street Segment Match	Required for Landmark Match	Exact Match Required if Present	Length	Position
Census block group	US Census block group number.					1	84
Census block ID	US Census block ID number.					3	85-87
RESERVED	RESERVED					5	88-92
State abbreviation	USPS state abbreviation.					2	93-94
County name	Name of the county.					25	95-119
MCD code	Minor Civil Division code.					5	120-124
MCD name	Minor Civil Division name.					40	125-164
CBSA code	Core Based Statistical Area code.					5	165-169
CBSA name	Core Based Statistical Area name.					49	170-218
RESERVED	RESERVED					5	219-223
City Name	City name. Overrides the city/state preferred city name upon a return.					40	224-263
RESERVED	RESERVED					237	264-500

Field	Description	Required	Required for Street Segment Match	Required for Landmark Match	Exact Match Required if Present	Length	Position
User-defined data	User-defined data.					300	501-800
Record ID Number	User-defined unique record identifier.					10	801-810
Side of street	Side of the street for the address: L - Left side R - Right side B - Both sides U - Unknown side (default) This is relative to the segment endpoints and the segment direction.					1	811
Beginning longitude	Beginning longitude of the street segment in millionths of degrees.	X	X	X		11	812-822
Beginning latitude	Beginning latitude of the street segment in millionths of degrees.	X	X	X		10	823-832
Ending longitude	Ending longitude of the street segment in millionths of degrees.					11	833-843
Ending latitude	Ending latitude of the street segment in millionths of degrees.					10	844-853

Match and Location Codes for U.S. Geocoding

Match Codes

The geocoder returns match codes indicating the address portions that matched or did not match to the database.

If the geocoder cannot make a match, the match code begins with "E" and the remaining digits indicate why the address did not match. For the descriptions of the "E" match codes, see [Match Codes for No Match - Definitions for "Ennn" return codes](#) on page 344. The digits do not specifically refer to which address elements did not match, but rather why the address did not match.

Match Codes

This section covers:

- [Match Code Definitions](#) on page 338
- [Definitions for 1st-3rd hex digit match code values](#) on page 340
- [Definitions for Extended Match Code \(3rd hex digit values\)](#) on page 341
- [Definitions for the Reverse PBKey Lookup "Vhhh" return codes](#) on page 343
- [Match Codes for No Match - Definitions for "Ennn" return codes](#) on page 344

Match Code Definitions

The table below contains the match code values.

For descriptions of the hex digits for the match codes, see [Definitions for 1st-3rd hex digit match code values](#) on page 340.

Code	Description
Ahhh	Same as Shhh, but indicates match to an alias name record or an alternate record.
Chh	The street address did not match, but the geocoder located a street segment based on the input ZIP Code or city
D00	Matched to a small town with P.O. Box or General Delivery only.
Ghhh	Matched to an auxiliary file.

Code	Description
Hhhh	The house number was changed.
Jhhh	Matched to a user-defined dictionary.
Nxx	Matched to the nearest address. Used with reverse geocoding. The following are the only values for N: <ul style="list-style-type: none"> NS0 Nearest street center match (nearest street segment interpolated) NS1 Nearest unranged street segment NP0 Nearest point address NX0 Nearest intersection
P	Successful reverse APN lookup.
Qhhh	Matched to USPS range records with unique ZIP Codes. CASS rules prohibit altering an input ZIP if it matches a unique ZIP Code value.
Rhhh	Matched to a ranged address.
Shhh	Matched to USPS data. This is considered the best address match, because it matched directly against the USPS list of addresses. S is returned for a small number of addresses when the matched address has a blank ZIP + 4.
Thhh	Matched to a street segment record.
Uhhh	Matched to USPS data but cannot resolve the ZIP + 4 code without the firm name or other information. CASS mode returns an E023 (multiple match) error code.
Vhhh	Matched to MLD and DVDMLDR using Reverse PBKey Lookup. For match code values, see Definitions for the Reverse PBKey Lookup "Vhhh" return codes on page 343.

Code	Description
Xhhh	Matched to an intersection of two streets, for example, "Clay St & Michigan Ave." The first hex digit refers to the last line information, the second hex digit refers to the first street in the intersection, and the third hex digit refers to the second street in the intersection. Note: The USPS does not allow intersections as a valid deliverable address.
Yhhh	Same as Xhhh, but an alias name record was used for one or both streets.
Z	No address given, but verified the provided ZIP Code .

Definitions for 1st-3rd hex digit match code values

The table below contains the description of the hex digits for the match code values.

Note: The third hex digit is only populated for intersection matches or as part of the Extended Match Code.

- For intersection matches, use the table below for the 3rd hex digit definitions.
- For Extended Match Code, see [Definitions for Extended Match Code \(3rd hex digit values\)](#) on page 341.

Code	In first hex position means:	In second and third hex position means:
0	No change in last line.	No change in address line.
1	ZIP Code changed.	Street type changed.
2	City changed.	Predirectional changed.
3	City and ZIP Code changed.	Street type and predirectional changed.
4	State changed.	Postdirectional changed.

Code	In first hex position means:	In second and third hex position means:
5	State and ZIP Code changed.	Street type and postdirectional changed.
6	State and City changed.	Predirectional and postdirectional changed.
7	State, City, and ZIP Code changed.	Street type, predirectional, and postdirectional changed.
8	ZIP + 4 changed.	Street name changed.
9	ZIP and ZIP + 4 changed.	Street name and street type changed.
A	City and ZIP + 4 changed.	Street name and predirectional changed.
B	City, ZIP, and ZIP + 4 changed.	Street name, street type, and predirectional changed.
C	State and ZIP + 4 changed.	Street name and postdirectional changed.
D	State, ZIP, and ZIP + 4 changed.	Street name, street type, and postdirectional changed.
E	State, City, and ZIP + 4 changed.	Street name, predirectional, and postdirectional changed.
F	State, City, ZIP, and ZIP + 4 changed.	Street name, street type, predirectional, and postdirectional changed.

Definitions for Extended Match Code (3rd hex digit values)

As mentioned in **Match Code** on page 231, when `ExtendedMatchCode` is set to "Y", additional information is returned about any changes in the house number, unit number and unit type fields in the matched address, as well as whether there was address information that was ignored. This

additional information is provided in a 3rd hex digit that is appended to match codes for address-level matches only - A, G, H, J, Q, R, S, T or U (see [Match Code Definitions](#) on page 338).

"Address information ignored" is specified when any of these conditions apply:

- The output address has content in the `AdditionalInputData` field.
- The output address has a second address line (`AddressLine2`).
- The input address is a dual address (two complete addresses in the input address). For example, "4750 Walnut St. P.O Box 50".
- The input last line has extra information that is not a city, state or ZIP Code, and is ignored. For example, "Boulder, CO 80301 USA", where "USA" is ignored when matching.

The table below provides the descriptions for the Extended Match Code 3rd hex digit return values:

Note: For Auxiliary file matches, the 3rd hex digit is always "0".

Code	In 3rd hex position means:
0	Matched on all address information on line, including Unit Number and Unit Type if included.
1	Matched on Unit Number and Unit Type if included. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> or <code>AdditionalInputData</code> field.
2	Matched on Unit Number. Unit Type changed.
3	Matched on Unit Number. Unit Type changed. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> or <code>AdditionalInputData</code> field.
4	Unit Number changed or ignored.
5	Unit Number changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> or <code>AdditionalInputData</code> field.
6	Unit Number changed or ignored. Unit Type changed or ignored.
7	Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> or <code>AdditionalInputData</code> field.
8	Matched on Unit Number and Unit Type if included. House Number changed or ignored.

Code	In 3rd hex position means:
9	Matched on Unit Number and Unit Type if included. House Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
A	Matched on Unit Number. Unit Type changed. House Number changed or ignored.
B	Matched on Unit Number. Unit Type changed. House Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
C	House Number changed or ignored. Unit Number changed or ignored.
D	House Number changed or ignored. Unit Number changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.
E	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored.
F	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2 or AdditionalInputData field.

Definitions for the Reverse PBKey Lookup "Vhhh" return codes

The table below lists the "Vhhh" hex digit values returned with Reverse PBKey Lookup. For more information, see [ReversePBKeyLookup](#).

Note: When there are one or more address variations for a Reverse PBKey Lookup, the match code returned is always "V000".

Match Code	Definition
V000	Match made using input pbKey. One Standard or Enhanced point address result returned depending on license.
V001	Match made using input pbKey. Multiple Standard and/or Enhanced point address variations results returned depending on license.
V002	Match made using input pbKey. One Standard, some Enhanced point address variations results returned depending on license.

Match Code	Definition
V003	Match made using input pbKey. Multiple Standard, some Enhanced point address variations results depending on license.

Match Codes for No Match - Definitions for "Ennn" return codes

The table below describes the values returned when the application cannot find a match or an error occurs.

Code	"nnn" values	Description
Ennn		Indicates an error, or no match. This can occur when the address entered does not exist in the database, or the address is badly formed and cannot be parsed correctly. The last three digits of an error code indicate which parts of an address the application could not match to the database.
	nnn = 000	No match made.
	nnn = 001	Low level error.
	nnn = 002	Could not find data file.
	nnn = 003	Incorrect GSD file signature or version ID.
	nnn = 004	GSD file out of date. Only occurs in CASS mode.
	nnn = 010	No city and state or ZIP Code found.
	nnn = 011	Input ZIP not in the directory.
	nnn = 012	Input city not in the directory.
	nnn = 013	Input city not unique in the directory.

Code	"nnn" values	Description
	nnn = 014	Out of licensed area. Only occurs if using Group 1 licensing technology.
	nnn = 015	Record count is depleted and license has expired.
	nnn = 020	No matching streets found in directory.
	nnn = 021	No matching cross streets for an intersection match.
	nnn = 022	No matching segments.
	nnn = 023	Unresolved match.
	nnn = 024	No matching segments. (Same as 022.)
	nnn = 025	Too many possible cross streets for intersection matching.
	nnn = 026	No address found when attempting a multiline match.
	nnn = 027	Invalid directional attempted.
	nnn = 028	Record also matched EWS data, therefore the application denied the match.
	nnn = 029	No matching range, single street segment found.
	nnn = 030	No matching range, multiple street segments found.
	nnn = 040	No match found using input PBKey with ReversePBKeyLookup.

Code	"nnn" values	Description
	nnn = 041	Not licensed to return Enhanced point address(es) found for input PBKey. Additional ReversePBKeyLookup license option required to return results.

Location Codes

Location codes indicate the locational accuracy of the assigned geocode. Note that an accurately placed candidate is not necessarily an ideal candidate. Examine the match codes and/or result codes in addition to location codes to best evaluate the overall quality of the candidate.

A Location Code of "E" indicates a location code is not available. This usually occurs when you have requested ZIP Code centroids of a high quality, and one is not available for that match. It can occur infrequently when the Enterprise Geocoding Module does not have a 5-digit centroid location. The Enterprise Geocoding Module can also return an "E" location code when it cannot standardize an input address and there is no input ZIP Code. In this case, do not assume the ZIP Code returned with the non-standardized address is the correct ZIP Code because the Enterprise Geocoding Module did not standardize the address; therefore, the Enterprise Geocoding Module does not return geocoding or Census Block information.

Address Location Codes

Location codes that begin with an "A" are address location codes. Address location codes indicate a geocode made directly to a street network segment (or two segments, in the case of an intersection).

An address location code has the following characters.

1 st character	Always an "A" indicating an address location.
2 nd character	May be one of the following:
	C Interpolated address point location
	G Auxiliary file data location
	I Application infers the correct segment from the candidate records
	P Point-level data location

	R	Location represents a ranged address
	S	Location on a street range
	X	Location on an intersection of two streets
3 rd and 4 th character		Digit indicating other qualities about the location.

Table 39: Address Location Codes

Code	Description
AGn	Indicates an Auxiliary file for a geocode match where n is one of the following values:
n = 0	The geocode represents the center of a parcel or building.
n = 1	The geocode is an interpolated address along a segment.
n = 2	The geocode is an interpolated address along a segment, and the side of the street cannot be determined from the data provided in the auxiliary file record.
n = 3	The geocode is the midpoint of the street segment.
APnn	Indicates a point-level geocode match representing the center of a parcel or building, where nn is one of the following values:
nn = 00	User Dictionary centroid. Geocode returned by a User Dictionary.

Code	Description
nn = 02	<p>Parcel centroid</p> <p>Indicates the center of an accessor's parcel (tract or lot) polygon. When the center of an irregularly shaped parcel falls outside of its polygon, the centroid is manually repositioned to fall inside the polygon as closely as possible to the actual center.</p>
nn = 04	<p>Address points</p> <p>Represents field-collected GPS points with field-collected address data.</p>
nn = 05	<p>Structure point</p> <p>Indicates a location within a building footprint polygon that is associated with the matched address.</p> <p>Usually, residential addresses consist of a single building. For houses with outbuildings (detached garages, sheds, barns, etc.), the structure point will typically fall on the primary structure.</p> <p>Condominiums and duplexes have multiple, individual addresses and may have multiple structure points for each building. Multi-unit buildings are typically represented by a single structure point associated with the primary/base address, rather than discrete structure points for each unit.</p> <p>Shopping malls, industrial complexes, and academic or medical center campuses are commonly represented by a single structure point associated with the primary/base address for the entire complex. When multiple addresses are assigned to multiple buildings within one complex, multiple structure points may be represented within the same complex.</p>
nn = 07	<p>Manually placed</p> <p>Address points are manually placed to coincide with the midpoint of a parcel's street frontage at a distance from the center line.</p>

Code	Description
nn = 08	<p>Front door point</p> <p>Represents the designated primary entrance to a building. If a building has multiple entrances and there is no designated primary entrance or the primary entrance cannot readily be determined, the primary entrance is chosen based on proximity to the main access street and availability of parking.</p>
nn = 09	<p>Driveway offset point</p> <p>Represents a point located on the primary access road (most commonly a driveway) at a perpendicular distance of between 33-98 feet (10-30 meters) from the main roadway.</p>
nn = 10	<p>Street access point</p> <p>Represents the primary point of access from the street network. This address point type is located where the driveway or other access road intersects the main roadway.</p>
nn = 21	<p>Base parcel point</p> <p>When unable to match to an input unit number, or when the unit number is missing from an address location with multiple units, the "base" parcel information is returned, the address is not standardized to a unit number, and additional information, such as an Assessor's Parcel Number, is not returned.</p>
nn = 22	<p>Backfill address point</p> <p>The precise parcel centroid is unknown. The address location assigned is based on two known parcel centroids.</p>
nn = 23	<p>Virtual address point</p> <p>The precise parcel centroid is unknown. The address location assigned is relative to a known parcel centroid and a street segment end point.</p>

Code	Description
nn = 24	Interpolated address point The precise parcel centroid is unknown. The address location assigned is based on street segment end points.
AIn	The correct segment is inferred from the candidate records at match time.
ASn	House range address geocode. This is the most accurate street interpolated geocode available.
AIn, ASn and ACnh share the same values for the 3 rd character "n" as follows:	
n = 0	Best location.
n = 1	Street side is unknown. The Census FIPS Block ID is assigned from the left side; however, there is no assigned offset and the point is placed directly on the street.
n = 2	Indicates one or both of the following: <ul style="list-style-type: none"> The address is interpolated onto a TIGER segment that did not initially contain address ranges. The original segment name changed to match the USPS spelling. This specifically refers to street type, predirectional, and postdirectional. <p>Note: Only the second case is valid for non-TIGER data because segment range interpolation is only completed for TIGER data.</p>
n = 3	Both 1 and 2.
n = 7	Placeholder. Used when starting and ending points of segments contain the same value and shape data is not available.

Code	Description
ACnh	Indicates a point-level geocode that is interpolated between 2 parcel centroids (points), a parcel centroid and a street segment endpoint, or 2 street segment endpoints.
The ACnh 4 th character "h" values are as follows:	
h = 0	Represents the interpolation between two points, both coming from User Dictionaries.
h = 1	Represents the interpolation between two points. The low boundary came from a User Dictionary and the high boundary, from a non-User Dictionary.
h = 2	Represents the interpolation between one point and one street segment end point, both coming from User Dictionaries.
h = 3	Represents the interpolation between one point (low boundary) and one street segment end point (high boundary). The low boundary came from a User Dictionary and the high boundary from a non-User Dictionary.
h = 4	Represents the interpolation between two points. The low boundary came from a non-User Dictionary and the high boundary from a User Dictionary.
h = 5	Represents the interpolation between two points, both coming from non-User Dictionaries.
h = 6	Represents the interpolation between one point (low boundary) and one street segment end point (high boundary). The low boundary came from a non-User Dictionary and the high boundary from a User Dictionary.

Code	Description
h = 7	Represents the interpolation between one point and one street segment end point and both came from non-User Dictionaries.
h = 8	Represents the interpolation between one street segment end point and one point, both coming from User Dictionaries.
h = 9	Represents the interpolation between one street segment end point (low boundary) and one point (high boundary). The low boundary came from a User Dictionary and the high boundary from a non-User Dictionary.
h = A	Represents the interpolation between two street segment end points, both coming from User Dictionaries.
h = B	Represents the interpolation between two street segment end points. The low boundary came from a User Dictionary and the high boundary from a non-User Dictionary.
h = C	Represents the interpolation between one street segment end point (low boundary) and one point (high boundary). The low boundary came from a non-User Dictionary and the high boundary from a User Dictionary.
h = D	Represents the interpolation between one street segment end point and one point, both coming from non-User Dictionary.
h = E	Represents the interpolation between two street segment end points. The low boundary came from a non-User Dictionary and the high boundary from a User Dictionary.

Code		Description
	$h = F$	Represents the interpolation between two street segment end points, both coming from non-User Dictionaries.
ARn		Ranged address geocode, where "n" is one of the following:
	$n = 1$	The geocode is placed along a single street segment, midway between the interpolated location of the first and second input house numbers in the range.
	$n = 2$	The geocode is placed along a single street segment, midway between the interpolated location of the first and second input house numbers in the range, and the side of the street is unknown. The Census FIPS Block ID is assigned from the left side; however, there is no assigned offset and the point is placed directly on the street.
	$n = 4$	The input range spans multiple USPS segments. The geocode is placed on the endpoint of the segment which corresponds to the first input house number, closest to the end nearest the second input house number.
	$n = 7$	Placeholder. Used when the starting and ending points of the matched segment contain the same value and shape data is not available.
AXn		Intersection geocode, where n is one of the following:
	$n = 3$	Standard single-point intersection computed from the center lines of street segments.
	$n = 8$	Interpolated (divided-road) intersection geocode. Attempts to return a centroid for the intersection.

Street Centroid Location Codes

Location codes that begin with "C" are street centroid location codes. Street centroid location codes indicate the Census ID accuracy and the position of the geocode on the returned street segment. Street centroids may be returned if the street centroid fallback option is enabled and an address-level geocode could not be determined.

A street centroid location code has the following characters.

1 st character	Always "C" indicating a location derived from a street segment.
2 nd character	Census ID accuracy based on the search area used to obtain matching Street Segment.
3 rd character	Location of geocode on the returned street segment.

The table below contains the values and descriptions for the location codes.

Character position	Code	Description
2 nd Character		
	B	Block Group accuracy (most accurate). Based on input ZIP Code.
	T	Census Tract accuracy. Based on input ZIP Code.
	C	Unclassified Census accuracy. Normally accurate to at least the County level. Based on input ZIP Code.
	F	Unknown Census accuracy. Based on Finance area.

Character position	Code	Description
	P	Unknown Census accuracy. Based on input City.
3 rd Character		
	C	Segment Centroid.
	L	Segment low-range end point.
	H	Segment high-range end point.

ZIP + 4 Centroid Location Codes

Location codes that begin with a "Z" are ZIP + 4 centroid location codes. ZIP + 4 centroids indicate a geocode could not be determined for the address, so the location of the center of the address's ZIP + 4 was returned instead. ZIP + 4 centroid location codes indicate the quality of two location attributes: Census ID accuracy and positional accuracy.

A ZIP + 4 centroid location code has the following characters.

1 st character	Always "z" indicating a location derived from a ZIP centroid.
2 nd character	Census ID accuracy.
3 rd character	Location type.
4 th character	How the location and Census ID was defined. Provided for completeness, but may not be useful for most applications.

Table 40: ZIP + 4 Centroid Location Codes

Character Position	Code	Description
2nd Character		
	B	Block Group accuracy (most accurate).
	T	Census Tract accuracy.
	C	Unclassified Census accuracy. Normally accurate to at least the County level.
3rd Character		
	5	Location of the Post Office that delivers mail to the address, a 5-digit ZIP Code centroid, or a location based upon locale (city). See the 4 th character for a precise indication of locational accuracy.
	7	Location based upon a ZIP + 2 centroid. These locations can represent a multiple block area in urban locations, or a slightly larger area in rural settings.
	9	Location based upon a ZIP + 4 centroid. These are the most accurate centroids and normally place the location on the correct block face. For a small number of records, the location may be the middle of the entire street on which the ZIP + 4 falls. See the 4 th character for a precise indication of locational accuracy.
4th Character		

Character Position	Code	Description
	A	Address matched to a single segment. Location assigned in the middle of the matched street segment, offset to the proper side of the street.
	a	Address matched to a single segment, but the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.
	B	Address matched to multiple segments, all segments have the same Block Group. Location assigned to the middle of the matched street segment with the most house number ranges within this ZIP + 4. Location offset to the proper side of the street.
	b	Same as methodology B except the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.
	C	Address matched to multiple segments, with all segments having the same Census Tract. Returns the Block Group representing the most households in this ZIP + 4. Location assigned to the middle of the matched street segment with the most house number ranges within this ZIP + 4. Location offset to the proper side of the street.
	c	Same as methodology C except the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.

Character Position	Code	Description
	D	Address matched to multiple segments, with all segments having the same County. Returns the Block Group representing the most households in this ZIP + 4. Location assigned to the middle of the matched street segment with the most house number ranges within this ZIP + 4. Location offset to the proper side of the street.
	d	Same as methodology D except the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.
	E	Street name matched; no house ranges available. All matched segments have the same Block Group. Location placed on the segment closest to the center of the matched segments. In most cases, this is on the mid-point of the entire street.
	F	Street name matched; no house ranges available. All matched segments have the same Census Tract. Location placed on the segment closest to the center of the matched segments. In most cases, this is on the mid-point of the entire street.
	G	Street name matched (no house ranges available). All matched segments have the same County. Location placed on the segment closest to the center of the matched segments. In most cases, this is on the mid-point of the entire street.
	H	Same as methodology G, but some segments are not in the same County. Used for less than .05% of the centroids.

Character Position	Code	Description
	I	Created ZIP + 2 cluster centroid as defined by methodologies A, a, B, and b. All centroids in this ZIP + 2 cluster have the same Block Group. Location assigned to the ZIP + 2 centroid.
	J	Created ZIP + 2 cluster centroid as defined by methodologies A, a, B, b, C, and c. All centroids in this ZIP + 2 cluster have the same Census Tract. Location assigned to the ZIP + 2 centroid.
	K	Created ZIP + 2 cluster centroid as defined by methodologies A, a, B, b, C, c, D, and d. Location assigned to the ZIP + 2 centroid.
	L	Created ZIP + 2 cluster centroid as defined by methodology E. All centroids in this ZIP + 2 cluster have the same Block Group. Location assigned to the ZIP + 2 centroid.
	M	Created ZIP+2 cluster centroid as defined by methodology E and F. All centroids in this ZIP + 2 cluster have the same Census Tract. Location assigned to the ZIP + 2 centroid.
	N	Created ZIP + 2 cluster centroid as defined by methodology E, F, G, and H. Location assigned to the ZIP + 2 centroid.
	O	ZIP Code is obsolete and not currently used by the USPS. Historic location assigned.

Character Position	Code	Description
	V	Over 95% of addresses in this ZIP Code are in a single Census Tract. Location assigned to the ZIP Code centroid.
	W	Over 80% of addresses in this ZIP Code are in a single Census Tract. Reasonable Census Tract accuracy. Location assigned to the ZIP Code centroid.
	X	Less than 80% of addresses in this ZIP Code are in a single Census Tract. Census ID is uncertain. Location assigned to the ZIP Code centroid.
	Y	Rural or sparsely populated area. Census code is uncertain. Location based upon the USGS places file.
	Z	P.O. Box or General Delivery addresses. Census code is uncertain. Location based upon the Post Office location that delivers the mail to that address.

Geographic Centroid Location Codes

Location codes that begin with "G" are geographic centroid location codes. Geographic centroids may be returned if the street centroid fallback option is enabled and an address-level geocode could not be determined. Geographic centroid location codes indicate the quality of a city, county, or state centroid.

A geographic centroid location code has the following characters.

1st character

Always "G" indicating a location derived from a geographic centroid.

2nd character

Geographic area type. One of the following:

M	Municipality (for example, a city)
C	County
S	State

Result Codes for International Geocoding

Candidates returned by Spectrum geocoders return another class of return codes that are referred to as International Geocoding Result Codes. Each attempted match returns a result code in the Geocoder.MatchCode output field.

International Street Geocoding Result Codes (S Codes)

Street level geocoded candidates return a result code beginning with the letter S. The second character in the code indicates the positional accuracy of the resulting point for the geocoded record.

Table 41: Street (S) Result Codes

S Result Code	Description
S1	Single close match with the point located at postal code centroid.
S3	Single close match with the point located at postal code centroid.
S4	Single close match with the point located at the street centroid. For databases vintage 2014 Q4 or newer, the input house number is returned with the candidate even if no such house number was found. The S4 code is followed by letters and dashes indicating match precision. See Interpreting S Result Codes on page 362
S5	Single close match with the point located at a street address position. The S5 code is followed by letters and dashes indicating match precision. For information about these letters, see Interpreting S Result Codes on page 362.
S7	Single match with the point located at an interpolated point along the candidate's street segment. When the potential candidate is not an address point candidate and there are no exact house number matches among other address point candidates, the S7 result is returned using address point interpolation. The point is interpolated according to the next highest or lowest address point candidate that both intersects the segment and whose house number is contained within the range of houses of the original candidate. By using known address reference points on the street segment, the S7 point can be adjusted to a more accurate position.

S Result Code	Description
S8	Single close match with the point located at either the single point associated with an address point candidate or at an address point candidate that shares the same house number. No interpolation is required. S8 returns are possible with point databases only.
S0	single match, no coordinates available (very rare occurrence).
SX	Single close match with the point located at street intersection.

Interpreting S Result Codes

For S (street geocoded) international result codes, eight additional characters describe how closely the address matches an address in the database. The characters appear in the order listed in the following table. Any non-matched address elements are represented by a dash.

For example, the result code S5--N-SCZA represents a single close match that matched the street name, street suffix direction, town, and postcode. The dashes indicate that there was no match on house number, street prefix direction, or thoroughfare type. The match came from the Street Range Address database. This record would be geocoded at the street address position of the match candidate.

Category	Description	Example
H	House number	18
P	Street prefix direction P is present if any of these conditions are satisfied: <ul style="list-style-type: none"> The candidate pre-directional matches the input pre-directional. The candidate post-directional matches the input pre-directional after pre- and post-directionals are swapped. The input does not have a pre-directional. 	North
N	Street name	Merivale
T	Street type	St

Category	Description	Example
S	<p>Street suffix direction</p> <p>S in result code is present if any of these conditions are satisfied:</p> <ul style="list-style-type: none"> The candidate post-directional matches the input post-directional. The candidate pre-directional matches the input post-directional after pre- and post-directionals are swapped. The input does not have a post-directional. 	W
C	City name	South Brisbane
Z	Postal code	4101
A, G, or U	<p>Database type used to obtain the match.</p> <ul style="list-style-type: none"> A—Street Range Address database. G—G-NAF Point Address Dictionary (Australia only). U—Customer (user-defined) database. 	A

International Postal Geocoding Result Codes (Z Codes)

Matches in the Z category indicate that a match was made at the postcode level. A postcode match is returned in either of these cases:

- You specified to match to postal code centroids. The resulting point is located at the postal code centroid with the following possible accuracy levels.
- There is no street level close match and you specified to fall back to postal code centroid.

Table 42: Postal (Z) Result Codes

Z Result Code	Description
Z1	Postal Code centroid match.
Z3	Full postal code centroid match. For Canada, this is an FSALDU centroid.

Postal level geocoded candidates return a result code beginning with the letter Z. Geocode Address World can generate a Z1 result code. Country-specific geocoders can often generate more accurate postcode results (with Z2 or Z3 result codes).

If the postal candidate comes from a user dictionary, the letter U is appended to the result. For example, Z1U indicates a postal centroid match from a custom user dictionary.

International Geographic Geocoding Result Codes (G Codes)

Geographic level geocoded candidates return a result code beginning with the letter G. The numbers following the G in the result code provides more detailed information about the accuracy of the candidate.

Table 43: Geographic (G) Result Codes

G Result Code	Description
G1	State or province centroid. match.
G2	County (district or region) centroid match.
G3	City or town (municipality) centroid match.
G4	Locality (village, suburb, or neighborhood) centroid match.

If the geographic candidate comes from a user dictionary, the letter U is appended to the result code. For example, G4U indicates a locality centroid match from a custom user dictionary.

Reverse Geocoding Codes (R Codes)

Matches in the R category indicate that the record was matched by reverse geocoding. The second two characters of the R result code indicate the type of match found. R geocode results include an additional letter to indicate the dictionary from which the match was made.

Example reverse geocoding codes:

Table 44: Reverse Geocoding (R) Result Codes

Reverse Geocoding Code	Description
RS8A	Point/parcel level precision for reverse geocoding. Candidate returned from address dictionary.

Reverse Geocoding Code	Description
RS5A	Interpolated street candidate for reverse geocoding. Candidate returned from address dictionary.
RS4A	Street centroid candidate for reverse geocoding. Candidate returned from address dictionary.

If the reverse geocoded candidate comes from a user dictionary, the letter U is appended to the result. For example, RS8U indicates a point/parcel level reverse geocode match from a custom user dictionary.

Non-match Codes

The following result codes indicate no match was made:

- **N**—No close match.
- **NX**—No close match for street intersections.
- **ND**—Spectrum™ Technology Platform could not find the geocoding database for the given postal code or municipality/state/province.

Encountering False Positives

What is a False-Positive?

To prevent the generation of address lists, the DPV and LACS^{Link} databases include false-positive records. False-positive records are artificially manufactured addresses that reside in a false-positive table. For each negative response that occurs in a DPV or LACS^{Link} query, a query is made to the false-positive table. A match to this table (called a false-positive match) disables your DPV or LACS^{Link} key. In batch processing the job that contains the violation will complete successfully but you will not be able to run any subsequent jobs that use DPV or LACS^{Link} until you report the violation and obtain a key to reactivate DPV or LACS^{Link}.

Note: The term "seed record violation" is also used to refer to encountering false positive records. The two terms mean the same thing.

Reporting DPV False-Positive Violations

Spectrum™ Technology Platform indicates a false-positive match via messages in the server log.

Client/server calls throw an exception if a false-positive match occurs. When a DPV false positive record violation occurs, the server log will say:

```
WARN [Log] Seed record violation for S<ZIP, ZIP+4, Address, Unit> ERROR
[Log] Feature Disabled: DPU: DPV Seed Record Violation. Seed Code:
S<Address, ZIP, ZIP+4, Unit>
```

Note: If a DPV false positive record is found, the process() method (COM, C++, Java, and .NET) will throw an exception that the feature DPU has been disabled. In C, the processMessage() function will return a non-zero value.

You can report the violation and obtain a restart key by following these steps.

1. In your browser, go to `http://<yourserver>:<port>/<product code>/dpv.jsp`. For example, `http://localhost:8080/unc/dpv.jsp` for the Universal Addressing Module and `http://localhost:8080/geostan/dpv.jsp` for the Enterprise Geocoding Module.
2. Enter the mailer's information into each field. The number in parentheses after each field name indicates the maximum length of the field.
3. Click **Submit** when you're done. A **File Download** dialog will appear.
4. Click **Save** to save the file to your computer. A **Save As** dialog will appear.
5. Specify a file name and location on your local hard drive (for example `c:\DPVSeedFile.txt`) and click **Save**.
6. Review the appropriate USPS information. For a DPV seed violation, review the USPS DPV Product Licensee Performance Requirements document at https://postalpro.usps.com/DPV_LPR.
7. Call Pitney Bowes Technical Support.

DPV False Positive Header File Layout

The USPS® has determined the required layout of the DPV false-positive header file, which is currently defined as a fixed-length file containing two or more 180-byte records. The first record must always be the header record, whose layout is shown below.

Table 45: DPV False-Positive Header Record Layout

Position	Length	Description	Format
1-40	40	Mailer's company name	Alphanumeric
41-98	58	Mailer's address line	Alphanumeric

Position	Length	Description	Format
99-126	28	Mailer's city name	Alphanumeric
127-128	2	Mailer's state abbreviation	Alphabetic
129-137	9	Mailer's 9-digit ZIP Code	Numeric
138-146	9	Total Records Processed	Numeric
147-155	9	Total Records DPV Matched	Numeric
156-164	9	Percent Match Rate to DSF	Numeric
165-173	9	Percent Match Rate to ZIP + 4 [®]	Numeric
174-178	5	Number of ZIP Codes on file	Numeric
179-180	2	Number of False-Positives	Numeric

The trailer record contains information regarding the DPV false-positive match. There must be one trailer record added to the false-positive file for every DPV false-positive match. The layout is shown below.

Table 46: DPV False-Positive Trailer Record Layout

Position	Length	Description	Format
1-2	2	Street predirectional	Alphanumeric
3-30	28	Street name	Alphanumeric

Position	Length	Description	Format
31-34	4	Street suffix abbreviation	Alphanumeric
35-36	2	Street postdirectional	Alphanumeric
37-46	10	Address primary number	Alphanumeric
47-50	4	Address secondary abbreviation	Alphanumeric
51-58	8	Address secondary number	Numeric
59-63	5	Matched ZIP Code	Numeric
64-67	4	Matched ZIP + 4 [®]	Numeric
68-180	113	Filler	Spaces

Reporting LACS/Link False-Positive Violations

Spectrum™ Technology Platform indicates a false-positive match via messages in the server log. Batch jobs will fail if a false-positive match occurs and client/server calls will throw an exception.

Note: The term "seed record violation" is also used to refer to encountering false positive records. The two terms mean the same thing.

When a false positive record is encountered, the server log will say:

```
2005-05-06 17:05:38,978 WARN [com.g1.component.ValidateAddress] Seed
record violation for RR 2 28562 31373
2005-05-06 17:05:38,978 ERROR [com.g1.component.ValidateAddress] Feature
Disabled: LLU: LACS Seed Record Violation. Seed Code: 28562 31373
2005-05-06 17:05:38,978 ERROR [com.g1.dcg.gateway.Gateway] Gateway
exception: com.g1.dcg.stage.StageException:
com.g1.dcg.component.ComponentException: Feature Disabled: LLU
2005-05-06 17:06:30,291 ERROR
[com.pb.spectrum.platform.server.runtime.core.license.impl.policy.Policy]
Feature LACSLink Real-time is disabled.
```

Note: If a LACS^{Link} false positive record is found, the process() method (COM, C++, Java, and .NET) will throw an exception that the feature LLU has been disabled. In C, the processMessage() function will return a non-zero value.

1. In your browser, go to `http://<ServerName>:<port>/<product code>/lacslink.jsp`. For example, `http://localhost:8080/unc/lacslink.jsp` for the Universal Addressing Module and `http://localhost:8080/geostan/lacslink.jsp` for the Enterprise Geocoding Module.
2. Enter the mailer's information into each field. The number in parentheses after the field name indicates the maximum length of the field. Click **Submit** when you're done. A **File Download** dialog will appear.
3. Click **Save** to save the file to your computer. A **Save As** dialog will appear.
4. Specify a file name and location on your local hard drive (for example `c:\lacslink.txt`) and click **Save**.
5. Review the appropriate USPS information. For a LACS^{Link} seed violation, review the LACS^{Link} End User Licensee Performance Requirements document at https://postalpro.usps.com/LL_EU_LPR.
6. Call Pitney Bowes Technical Support.

Enterprise Tax Module

Enterprise Tax Module

Note: The Enterprise Tax Module processes only U.S. addresses.

The Enterprise Tax Module determines the tax jurisdiction for an address. The Enterprise Tax Module takes an address, standardizes it, then matches the address to an exact physical location, returning latitude/longitude coordinates with the correct tax jurisdictions for the address. This solution greatly reduces the inaccuracies associated with matching to 9-digit and 5-digit ZIP Codes. The Enterprise Tax Module can also calculate latitude and longitude coordinates for individual address locations, including the use of interpolation and offset.

For companies that deliver goods or services to locations that don't have a recognizable address, the Enterprise Tax Module can accept latitude/longitude coordinates as input to return the tax jurisdictions and corresponding GeoTAX Key values. Examples of this type of location include bill boards, street lights, communications towers, or new housing developments.

The Enterprise Tax Module uses a database of tax jurisdictions provided by TomTom. This data, which is collected through an ongoing research program and updated regularly, provides current jurisdictional boundary information down to the municipal and special tax district levels.

In addition to determining the tax jurisdiction for an address or location, with the optional Pitney Bowes Sales and Use Tax Rate file, the Enterprise Tax Module can return sales and use tax rates for each of the assigned tax jurisdictions as well as the total tax rate for the assigned locations. There is also the option to use other software, such as Vertex or Sovos, to cross-reference and supply tax rate data.

Components

The Enterprise Tax Module consists of:

- **Assign GeoTAX Info** - Takes an input address and returns census, latitude/longitude, and tax information about the address. Assign GeoTAX Info utilizes Pitney Bowes' GeoTAX technology.
- **Calculate Distance** - Returns the distance between two input coordinates.
- **Reverse GeoTAX Info Lookup** - Returns census and tax information about an input location. This service does not return an address for a location.

Enterprise Tax Databases

The Enterprise Tax Module provides you with several different databases along with the ability to include additional databases to match against your input addresses or geographic coordinates.

Database Name and Description	Required or Optional	Supplier
<p>GeoTAX/Enterprise Tax Premium Master Files</p> <p>The master files are the main data files used by the Enterprise Tax Module. They identify all geographic components associated with a street address, such as the tax jurisdictions, latitude/longitude coordinates, census tract, and block group. These files, at over two gigabytes of data, are significantly larger than the postal file, but provide the greatest coding accuracy.</p> <p>Note: The GeoTAX/Enterprise Tax Premium Database is a required data set and is the master file for the Enterprise Tax Premium Module software. This data is not compatible with versions of the Enterprise Tax Module prior to version 9.0 SP3.</p> <p>The master files are available for download from the Pitney Bowes Software and Data Marketplace, as well as Pitney Bowes eStore.</p>	Required	Pitney Bowes monthly/quarterly subscription
<p>Point Data Files</p> <p>Point data products include Master Location Data (MLD), Centrus Points, HERE Points, and TomTom Points. The point data provides point-level geocoding for the most accurate placement of addresses throughout the U.S. The Master Location Data database provides the best available address point location for every mailable and deliverable address in the United States.</p>	Optional	Pitney Bowes monthly subscription

Database Name and Description	Required or Optional	Supplier
<p>State-Supplied Files</p> <p>State-supplied files are provided by individual state governments that the Enterprise Tax Module uses to override results from the master files.</p> <p>The Enterprise Tax Module provides you with the ability to override, at the state level, match results based upon information supplied by the states. By matching to the state-supplied files, you can remain compliant with tax jurisdiction assignment requirements mandated by new federal and state laws, such as the Mobile Telecommunications Sourcing Act and the Florida state Communications Services Tax Simplification Law.</p> <p>Currently, there are two file formats supported in the Enterprise Tax Module: the Florida-native format, and the national TS-158 format (ANSI Transaction Set No. 158). The state of Florida provides address files in both the TS-158 and its own native format.</p> <p>Note: This database option may not be available to all Enterprise Tax Module users. Individual states may restrict the use of state-supplied address files to licensed communications carriers or other business entities registered with the individual state.</p> <p>The Enterprise Tax Module first attempts to match to the state database. If the Enterprise Tax Module cannot find a state match, it attempts a match to the GeoTAX Auxiliary file, if loaded, then to the master files.</p>	Optional	State Governments
<p>GeoTAX Auxiliary File</p> <p>The GeoTAX Auxiliary file contains new addresses that have not yet been added to the master files. It provides the most up-to-date address data possible.</p>	Optional	Pitney Bowes monthly subscription
<p>Landmark Auxiliary File</p> <p>The Landmark Auxiliary File is a user-defined file that allows you to specify customized address information in your input records. The recommended primary use of this file is to match to your company's non-address locations such as well heads, transmission towers or any other descriptive location. The latitude/longitude coordinates that is part of the input needed to build this file allows companies to automatically keep track of any jurisdictional changes that affect these unique locations. Matching to this file requires that the input record information match exactly to the Landmark Auxiliary file contents. This also applies to street records if you choose to enter them in the Landmark Auxiliary file.</p> <p>Note: For more information, see Creating a Landmark Auxiliary File on page 496.</p>	Optional	User-defined

Database Name and Description	Required or Optional	Supplier
<p>User Auxiliary File</p> <p>User Auxiliary files are user-defined files that the Enterprise Tax Module uses to override results from the master files in street-level matching. If you have data that is more current than that in the master files, you can enter the new data into the auxiliary file and use it for your address matching. The Enterprise Tax Module returns matches made with a code that signifies the answer came from the auxiliary file. You can also return user-defined data from the auxiliary file with the match.</p> <p>Note: For more information, see Creating a User-Defined Auxiliary File on page 502.</p>	Optional	User-defined
<p>Boundary Files</p> <p>Boundary files provide additional data about locations of special tax districts: Special Purpose Tax Districts (SPD), Insurance Premium Tax Districts (IPD), Payroll Tax Districts (PAY), and User-Defined Boundary (USR) .</p> <ul style="list-style-type: none"> • The Special Purpose Districts file (SPD.txb) provides you with return data on special purpose tax districts. Special purpose tax districts include such districts as Regional Transit Areas and Metropolitan Football districts. • The Insurance Premium Districts file (IPD.txb) is used by the insurance industry to determine sales tax on insurance premiums written in some states. This file allows insurers to correctly determine the rate due on each insurance policy. Boundaries vary by state and are based on fire and police district and municipal boundaries. • The Payroll Tax Districts file (PAY.txb) can help your company comply with state legislation that requires employers to deduct taxes from employee paychecks for special districts, such as taxes for emergency municipal services districts. <p>Pitney Bowes provides you with the appropriate boundary file on separate media if you license any of the optional files.</p> <p>Important: The Enterprise Tax Module only uses one boundary file at a time. For more information, see the configuration options in AssignGeoTAXInfo on page 375.</p>	Optional	Pitney Bowes
<p>User-Defined Boundary File</p> <p>A user-defined boundary file (usr.txb) is a file that you create to represent polygons that you want to match against, such as sales territories, insurance rating territories, or any geographic areas that are of interest to you.</p> <p>Note: For more information, see Creating a User-Defined Boundary File on page 505.</p>	Optional	User-created

Database Name and Description	Required or Optional	Supplier
<p>Pitney Bowes Sales and Use Tax Rate File</p> <p>You can optionally license the Pitney Bowes Sales and Use Tax Rate file to supply sales and/or use tax rate data for the general, automotive, construction or medical industries. Sales and use tax rates can be returned for each of the assigned tax jurisdictions as well as the total tax rate for the assigned locations.</p>	Optional	Pitney Bowes
<p>Sales Tax Cross-Reference Files</p> <p>Sales tax cross-reference files allow you to use the Enterprise Tax Module to determine tax jurisdictions for a given address, then use third-party software to determine the sales tax rates for those jurisdictions. The cross-reference files combine the U.S. Government Federal Information Processing Standards (FIPS) codes with the proprietary geocodes used by tax software from third parties.</p> <p>Important: When using a cross-reference file, the SPD file must also be loaded.</p> <ul style="list-style-type: none"> • PBS Vertex File—The PBS Vertex file enables you to integrate the Enterprise Tax Module with tax compliance software from Vertex, Inc. With this file, the Enterprise Tax Module component AssignGeoTAXInfo can return the nine-digit Vertex jurisdiction code for an address. You can then match these codes to the Vertex tax tables, which tell you the tax rate for each jurisdiction. To use the PBS Vertex file you must have the PBS Vertex file from Pitney Bowes to build the cross reference. • Sovos Files—The Sovos files enable you to integrate the Enterprise Tax Module with tax compliance software from Sovos. With this file, the Enterprise Tax Module component AssignGeoTAXInfo can return the Sovos jurisdiction code for an address. You can then match these codes to the Sovos tax tables, which tell you the tax rate for each jurisdiction. The Sovos files are supplied by Pitney Bowes and support both the SUT and TWE Sovos versions. 	Optional	Pitney Bowes
<p>Payroll Tax Cross-Reference Files</p> <p>Payroll tax cross-reference files allow you to use third-party software to determine the payroll tax rates. The cross-reference files combine the U.S. Government Federal Information Processing Standards (FIPS) codes with the proprietary geocodes used by tax software from third parties. The Payroll System Tax Code file is a customized file that you build to return the payroll tax codes used by your payroll system.</p> <p>Note: For more information, see Using a Payroll Tax Correspondence File on page 492.</p>	Optional	Pitney Bowes

Adding an Enterprise Tax Module Database Resource

Whenever you install a new database resource or modify an existing database resource you must define it in Management Console in order for it to become available on your system. This procedure describes how to add or modify Enterprise Tax Module database resources.

1. If you haven't already done so, install the dataset files on your system. For instructions on installing databases, see the *Spectrum™ Technology Platform Installation Guide*.
2. In Management Console, under **Resources**, choose **Spectrum Databases**.
3. To create a new database resource, click the Add button . To make changes to an existing database resource, select it, then click the Edit button . To delete a database resource, select it, then click the Delete button . You can also create a new database resource by copying an existing one, by clicking the Copy button .
4. If you are creating a new database, enter a name for the database resource in the **Name** field. The name can be anything you choose. If you are creating a new database by copying an existing one, rename the default name as needed. You cannot modify the name of an existing database resource, because any services or jobs that reference the database resource by its original name would fail.
5. In the **Pool size** field, specify the maximum number of concurrent requests you want this database to handle.

The optimal pool size varies by module. You will generally see the best results by setting the pool size between one-half to twice the number of CPUs on the server, with the optimal pool size for most modules being the same as the number of CPUs. For example, if your server has four CPUs you may want to experiment with a pool size between 2 (one-half the number of CPUs) and 8 (twice the number of CPUs) with the optimal size possibly being 4 (the number of CPUs).

6. In the **Module** field, select `Enterprise Tax Module`. The **Type** field, `Enterprise Tax Module`, is selected by default.
7. Under **Required Databases**, specify the folder that contains the GeoTAX master files. You can either type in the path or click the Browse button  to locate and select the top-level folder containing the dataset folders and files.
8. If you have **Optional Databases**, select the associated database field and either specify the path to the folder that contains the dataset files or click the Browse button  to locate and select the top-level folder containing the dataset folders and files.

Under **Enhanced Accuracy**, specify the folder that contains your point level files. To allow sharing your point level data with other Spectrum™ Technology Platform modules or services, the folder containing your point level files may be in a directory other than the default Enterprise Tax Module database install location.

For a state-supplied file or sales tax cross-reference file, use the dropdown menu to the left of the database input field to select the type of file, then enter the path to the top-level folder containing the dataset folders and files.

9. When you are done with your changes, click **Save**.

Database Search Order

The Enterprise Tax Module is able to process addresses using multiple databases at the same time. This allows you to find the best possible match from a variety of data sources and types of data (point as well as street segment data).

The Enterprise Tax Module processes these multiple data sources using a default search order. When Enterprise Tax Module matches an address exactly, it stops searching rather than continuing the search in additional databases. This saves on processing time. When an exact match is not found, Enterprise Tax Module continues searching all of the available data sources for candidate address matches. The candidates are then scored and the highest scoring match from all of the data sources is returned as the match. If multiple candidates receive an identical score when matched to either the Points or Streets files, you have the option to set what results should be returned.

The default search order for the Enterprise Tax Module is:

- Landmark Auxiliary file
- User Auxiliary file
- State-supplied file
- GeoTAX Auxiliary file
- Points file, if licensed
- Streets file

AssignGeoTAXInfo

AssignGeoTAXInfo identifies the tax districts that apply to a given address. Specifically, AssignGeoTAXInfo returns the following information about an address:

- Latitude/longitude coordinates
- FIPS state codes and county codes
- County names
- MCD/CCD codes and names
- CBSA/CSA codes and names
- Place FIPS and GNIS codes and names
- Incorporated or unincorporated status codes
- Cross-reference tax keys
- Result indicators
- Optionally, the relationship of an address to user-defined polygons

AssignGeoTAXInfo optionally includes enhanced tax jurisdiction information for an address, including:

- **Insurance premium districts**—Areas designated for the collection of taxes imposed on insurance policy premiums based on the policy holder's address. Insurance premium districts are created by state governments.
- **Payroll tax districts**—Areas designated for the collection of taxes imposed on employers to support state or local government facilities and services based on the employee's and/or employer's address. Examples include taxes collected for districts to pay for schools, police, or other services. Payroll tax districts are created by state or local governments.
- **Payroll system tax codes**—Codes that represent specific jurisdictions that collect payroll tax. Using payroll system tax codes has advantages over using the payroll tax district information returned by Assign GeoTAX Info:
 - AssignGeoTAXInfo uses an additional database to determine payroll tax codes, resulting in more accurate payroll tax determination.
 - Many payroll systems use specific codes to determine withholding amounts. Since you can customize the payroll tax codes returned by AssignGeoTAXInfo, you can set up a process where AssignGeoTAXInfo returns the exact payroll tax codes required by your payroll system instead of returning jurisdictional IDs that must then be translated into the codes used by your system.
- **Special purpose tax districts**—Areas designated for the collection of taxes imposed on residents to support specialized services for residents of the district based on the resident's address. Examples include services such as sewer service, transit service, or water resources. Special purpose tax districts are created by legislative action, court action, or public referendums. This optional information requires the use of boundary files which require an additional license. Contact your Pitney Bowes sales representative for more information.
- **Sales and Use Tax Rates**—Using the optional Pitney Bowes Sales and Use Tax Rate file, AssignGeoTAXInfo can return sales and use tax rates for each of the assigned tax jurisdictions as well as the total tax rate for the assigned locations.

AssignGeoTAXInfo is part of the Enterprise Tax Module.

Determining Tax Rates with AssignGeoTAXInfo

AssignGeoTAXInfo determines tax jurisdictions that apply to a given location. There are several options for determining tax rates for a location: use the optional Pitney Bowes Sales and Use Tax Rate file, use other software, such as Vertex or Sovos, or develop a custom process.

- Using Pitney Bowes Sales and Use Tax Rate file:
 - a) To include tax rate data in the output, set **GeoTAXOutputRecordType = B**.
 - b) To select the tax rate type, set **TaxRate** to one of the following:
 - G** - Return the General sales and use tax rates.
 - A** - Return the Automotive sales and use tax rates.
 - C** - Return the Construction sales and use tax rates.
 - M** - Return the Medical sales and use tax rates.

This option returns the `SPDnDistrictCode` field that you will need to return the correct tax rates. For more information, see .

- Using Vertex or Sovos Software:

- To include Tax Jurisdiction fields in the output, which includes the `GeoTAXKey` field that contains the Vertex or Sovos code, set **GeoTAXOutputRecordType = T**.
- To select the vendor information, set **TaxKey** to one of the following:

T - Return the Sovos jurisdiction code for the address.

V - Return the Vertex jurisdiction code for the address. Select this option if you obtained a Vertex file from Pitney Bowes.

This option returns the `SPDnDistrictCode` field that you will need to return the correct `GeoTAXKey`. For more information, see [Special Purpose Tax Districts](#) on page 425.

- Using a Custom Process:

If your organization has defined custom tax codes, you can use the jurisdiction information returned by `AssignGeoTAXInfo` to look up the tax jurisdictions in your custom tables. To do this, you need to configure `AssignGeoTAXInfo` to return the following fields:

- `StateCode`
- `County.Code`
- `GNISCode` or `Place.Code`
- `SPDn.DistrictCode`

To include these fields in the output:

- To include Tax Jurisdiction fields in the output, set **GeoTAXOutputRecordType = T**.
- To include Special Purpose Districts fields in the output, set **GeoTAXOutputRecordType = S**. This option returns the `SPDnDistrictCode` field that you will need to use with your custom look up table. For more information, see [Special Purpose Tax Districts](#) on page 425.

Address Matching

AssignGeoTAXInfo takes a house address and matches it to the correct street segment. Using the house number, it determines the side of the street on which the house resides (usually based on an odd-even division). Knowing the correct side of the street is important because streets are often the boundaries between municipalities or other adjoining jurisdictions that may have different tax rates. Thus, two addresses on the same street, in the same city, within the same ZIP Code could exist in different jurisdictions and have different tax rates.

After AssignGeoTAXInfo identifies the correct street segment, it determines the actual physical location of the house based on known latitudes/longitudes and other geographic data in the street segment database. AssignGeoTAXInfo returns the coordinates of the house, along with other data.

Point-level matching

Point-level matching locates the center of the actual building footprint or parcel. This is the most accurate type of geocode.

If you are licensed for the point-level data option, you do not need to execute any additional initialization or setup for your system to begin using the point-level data. The Enterprise Tax Module automatically processes your address lists through the point-level data.

When processing address lists, the Enterprise Tax Module first searches for a match in the point-level data. If it cannot find an exact match in the point-level data, the Enterprise Tax Module continues searching for a better match in the street network data. The Enterprise Tax Module returns the best match found, with preference given to matches from the point-level dataset.

Note: Point data must be used in conjunction with a standard street data set.

Buffering

Use buffering to define areas that are close to the edges of a polygon, line, or point.

Buffered Polygon (zone)

Buffered Line (corridor)

Buffered Point (circle)

For example, if you work for an insurance company you may want to know if a potential customer's house is within 500 feet of a flood plain so that you can suggest that they buy flood insurance even though they are not actually within the flood plain. The following illustration shows this scenario using a buffered polygon. The dotted line indicates the boundary of the flood plain and the shaded area shows a 500-foot buffer zone around the boundary.

The buffer area extends on both sides of the boundary (inside and outside). When you use buffering, the output field BufferRelation indicates whether or not the point is in the buffered zone, and whether the point is inside or outside of the polygon, as shown in the following illustrations.

The point is inside the polygon and not in the buffer area.
The output field BufferRelation will contain "P".

The point is inside the polygon and in the buffer area.
The output field BufferRelation will contain "I".

The point is outside the polygon but in the buffer area.
The output field BufferRelation will contain "B".

Specify the size of polygon buffers using the BufferWidth input field to set it on a record-by-record basis and the DefaultBufferWidth option to set a default polygon buffer width for the job.

Input

The following table provides information about the format of AssignGeoTAXInfo input.

columnName	Format	Description
AddressLine1	String [100]	First address line
AddressLine2	String [100]	Second address line
AddressLine3	String [100]	Third address line
AddressLine4	String [100]	Fourth address line
BufferWidth	String [10]	<p>Specifies the width of the polygon buffers to use for Boundary File processing. The buffer width is used to determine if a point is close to the edge of a polygon. The output field BufferRelation indicates whether or not the point is within the polygon's buffer area. For more information, see Buffering on page 378.</p> <p>This field overrides the value specified in the DefaultBufferWidth option. Specify the border width in the units specified by the DistanceUnits option.</p> <p>If you do not specify a buffer width in this input field, the default is used.</p>
City	String [50]	City name
Country	String [var]	<p>The country where the address resides. The data you enter in this field has no impact on processing. It is simply passed through to output.</p> <p>Note: Only US addresses are supported.</p>
FirmName	String [var]	The company or firm name.

columnName	Format	Description
PostalCode	String [9]	Nine-digit ZIP Code
StateProvince	String [50]	The state where the address resides. The data you enter in this field has no impact on processing. It is simply passed through to output.
UserBufferWidth	Long [10]	<p>Specifies the width of the polygon buffers to use for User-Defined Boundary File processing. The buffer width is used to determine if a point is close to the edge of a polygon. The output field <code>BufferRelation</code> indicates whether or not the point is within the polygon's buffer area. For more information, see Buffering on page 378.</p> <p>This field overrides the value specified in the <code>DefaultBufferWidth</code> option. Specify the border width in the units specified by the <code>DistanceUnits</code> option.</p> <p>If you do not specify a buffer width in this input field, the default is used.</p>

Matching Options

Matching options control the address search methodology and match results handling returned by AssignGeoTAXInfo.

optionName	Description
------------	-------------

Optional files: The following options enable the database resource(s) to use in the search process.

UseGeoTaxAuxiliaryFile	Specifies whether or not AssignGeoTAXInfo should attempt a match to the GeoTAX Auxiliary file. The GeoTAX Auxiliary file contains new addresses that have not yet been added to the Master File.
------------------------	--

Y	Use the GeoTAX Auxiliary file for matching. (default)
N	Do not use the GeoTAX Auxiliary file for matching.

UseAuxiliaryFile	Specifies whether to attempt a match to a User Auxiliary file. User Auxiliary files are user-defined files that override results from the master files in street-level matching.
------------------	--

Y	Use the User Auxiliary file for matching.
N	Do not use the User Auxiliary file for matching. (default)

UseStateProvidedFile	Specifies whether to attempt a match to the state-supplied file. Use this option in combination with <code>FileSearchOrder</code> to specify a state-supplied file to use.
----------------------	--

State-supplied files are provided by individual state governments. By matching to the state-supplied files, you can remain compliant with tax jurisdiction assignment requirements mandated by new federal and state laws, such as the Mobile Telecommunications Sourcing Act and the Florida state Communications Services Tax Simplification Law.

There are two supported file formats: the Florida-native format and the national TS-158 format (ANSI Transaction Set No. 158). The state of Florida provides address files in both the TS-158 and its own native format.

If this option is enabled, the address is first matched to the state supplied file. If a state match cannot be found, the master files are used to attempt a match.

Y	Use the State-supplied file for matching.
N	Do not use the State-supplied file for matching. (default)

Note: You must install the appropriate State-supplied file to use these options. For instructions, see the *Spectrum™ Technology Platform Installation Guide*.

optionName	Description
FileSearchOrder	<p>Specifies which state-supplied file to use. This option only takes effect if you specify <code>UseStateProvidedFile=Y</code>. One of the following:</p> <p>FLOnly Use only the Florida-native formatted file. (default)</p> <p>TSOnly Use only the TS-158 formatted file.</p>
UseRelaxedSecondaryMatching	<p>Specifies whether input addresses with secondary information are matched to records without secondary information. This option applies only to Florida-native files.</p> <p>Y Use relaxed secondary matching.</p> <p>N Do not use relaxed secondary matching. (default)</p>

Address Searching and Matching: These options can be enabled for use in the address search and match processes.

GsMatchMode	<p>Match modes determine the leniency used to make a match between your input and the reference database. Select a match mode based on the quality of your input and your desired output. For example, if you have an input database that is prone to errors, you may want to select the relaxed match mode.</p> <p>0 - Exact Requires a very tight match. This restrictive mode generates the fewest match candidates, which decreases the processing time. When using this mode, ensure that your input is very clean; free of misspellings and incomplete addresses.</p> <p>1 - Close Requires a close match and generates a moderate number of match candidates. (default)</p> <p>2 - Relaxed Allows a loose match and generates the most match candidates, which increases the processing time and results in more multiple matches. Use this mode if you are not confident that your input is clean; free of misspellings and incomplete addresses. This is the only mode that does not respect the street parity when making an address match.</p>
-------------	---

optionName	Description
GsSearchArea	<p>The search area options allow for searching the address' finance area or an expanded area specified by distance.</p> <ol style="list-style-type: none"> 1 Searches the entire finance area for a match. A finance area is a region defined by the U.S. Postal Service and typically consists of a set of contiguous ZIP Codes.(default) 2 Searches the area specified by the radius in miles. The search area can be extended up to a 99-mile radius from the centroid of the input ZIP Code to assist in finding a match when the input address contains limited or inaccurate city or ZIP Code information. The expanded area is confined to within the state's borders.
GsSearchRadius	<p>Radius for search area.</p> <p>1-99 miles Search radius. (default = 0 miles)</p>
GsEnableFirstLetterExpanded	<p>Looks for the correct first letter of a street address if the first letter is missing or incorrect. The Enterprise Tax Module searches through the alphabet looking for possible correct first letters to complete the street address.</p> <p>Note: This feature is disabled by default and cannot be enabled in Exact mode.</p> <p>Y Enable first letter change matches.</p> <p>N Do not allow first letter change matches. (default)</p>
GsEnableRangedAddress	<p>Matches to a house range input. Some business locations are identified by address ranges. For example, a shopping plaza could be addressed as 10-12 Front St. - this is how business mail is typically addressed to such a business location. When this feature is enabled, the address range is geocoded to the interpolated mid-point of the range.</p> <p>Note: This feature is disabled by default and cannot be enabled in Exact mode.</p> <p>Y Allow address range matches.</p> <p>N Do not allow address range matches. (default)</p>

optionName	Description
GsAlternateLookup	<p>This option allows specifying the preferred way to match when both an address and firm name are provided. The matching method can be set to match to the address rather than the firm name or vice versa. If neither are specified, the default matching method is to match to the address line only.</p> <ol style="list-style-type: none"> 1 Searches for street name, but if there isn't a match, will use the firm name. 2 Looks up the firm name, but if there isn't a match, will use the street name. 3 Searches only street records. (default)
GsMultiMatchResolution	<p>A multi-match occurs when multiple equally-scored matches are found in either the Points or Streets files and cannot be resolved to a single best candidate. There are several choices for handling a multi-match outcome:</p> <ol style="list-style-type: none"> N No matches are returned. (default) R Return the first match candidate in the list. A The information for all the match candidates is returned.

Specifying Default State-Supplied File Options

If you use the Spectrum™ Technology Platform API, note that the value you specify in the Management Console for the **State supplied file** field controls the default settings for three AssignGeoTAXInfo API options: `UseStateProvidedFile`, `UseRelaxedSecondary`, and `FileSearchOrder`. The table below shows how each value in the **State supplied file** field affects these three options.

"State supplied file" value	UseStateProvidedFile	FileSearchOrder	UseRelaxedSecondary
None	N	N/A	N
Florida-native	Y	FSOnly	N
Florida-native with relaxed secondary matching	Y	FSOnly	Y
TS-158	Y	TSOnly	N

Geocoding Options

Geocoding is the process of determining the latitude/longitude coordinates of a given address. Address coordinates are used as the basis for determining the tax jurisdictions for an address. Geocoding options control how AssignGeoTAXInfo determines address latitude/longitude coordinates.

optionName	Description
------------	-------------

Latitude/Longitude placement: These options can be set for the geocode result.

LatLongOffset	<p>Indicates the offset distance in feet from the street center line.</p> <p>The offset distance is used in street-level geocoding to prevent the geocode from being in the middle of a street. It compensates for the fact that street-level geocoding returns a latitude and longitude point in the center of the street where the address is located. Since the building represented by an address is not on the street itself, you do not want the geocode for an address to be a point on the street. Instead, you want the geocode to represent the location of the building which sits next to the street. For example, an offset of 40 feet means that the geocode will represent a point 40 feet back from the center of the street. The distance is calculated perpendicular to the portion of the street segment for the address. Offset is also used to prevent addresses across the street from each other from being given the same point. The diagram below shows an offset point in relation to the original point.</p> 								
	<table border="0"> <tbody> <tr> <td>0</td> <td>No offset. (default)</td> </tr> <tr> <td>20</td> <td>Twenty feet offset from street centerline.</td> </tr> <tr> <td>40</td> <td>Forty feet offset from street centerline. (recommended)</td> </tr> <tr> <td>60</td> <td>Sixty feet offset from street centerline.</td> </tr> </tbody> </table>	0	No offset. (default)	20	Twenty feet offset from street centerline.	40	Forty feet offset from street centerline. (recommended)	60	Sixty feet offset from street centerline.
0	No offset. (default)								
20	Twenty feet offset from street centerline.								
40	Forty feet offset from street centerline. (recommended)								
60	Sixty feet offset from street centerline.								

optionName	Description
Squeeze	<p data-bbox="617 325 1427 493">Specifies if the street end points should be "squeezed" when determining the geocode of an address in street-level matching. When <code>Squeeze</code> is enabled, both street and end points are moved closer to the center of the segment by 50 feet. The diagram below compares the end points of a street segment to the squeezed end points of a street segment.</p>  <p data-bbox="633 808 1104 888"> Y Apply squeeze. N Do not apply squeeze. (default) </p>

LatLongFormat	<p data-bbox="617 970 1419 1039">Indicates the desired format for the returned latitude/longitude. One of the following:</p> <p data-bbox="617 1050 1419 1113">PreZero Decimal degrees using directional indicator (no decimal point). For example, 090000000N180000000W.</p> <p data-bbox="617 1123 1419 1186">PreZeroDecimal Decimal degrees using directional indicator. For example, 090.000000N180.000000W. (default)</p> <p data-bbox="617 1197 1419 1260">Decimal Decimal degrees using signed latitude/longitude. For example, 90.000000-180.000000.</p> <p data-bbox="617 1270 1419 1333">DecimalAssumed Decimal degrees using signed latitude/longitude (no decimal point). For example, 90000000-180000000.</p> <p data-bbox="617 1344 1419 1407">DegMinSec Degrees, minutes, seconds. For example, 90 00 00N180 00 00W.</p>
---------------	---

Expanded Geocoding options: These options enable additional geocoding functionality.

optionName	Description
GsEnableAddressPointInterpolation	<p data-bbox="630 331 1429 426">Address point interpolation uses a patented process that improves upon regular street segment interpolation by inserting point data into the interpolation process.</p> <p data-bbox="711 436 1349 468">Note: This feature is only for use with point-level geocoding.</p> <p data-bbox="630 520 1429 667">A match is first attempted using the loaded points data. If an exact point match is found in the points data, then searching ceases and the point match is returned. If an exact point match was not found, the Enterprise Tax Module attempts to find high and low boundary address points to use for address point interpolation.</p> <p data-bbox="630 678 1138 709">Y Enable address point interpolation.</p> <p data-bbox="630 720 1239 751">N Disable address point interpolation. (default)</p>
Minimum geocode quality	
GsEnableGeographicFallback	<p data-bbox="630 951 1429 1045">The default search does not perform a search of geographic centroids. When enabled, the Geographic Fallback feature locates the first city, county and/or state centroid, and then matches from the set of possible matches found.</p> <p data-bbox="630 1056 1419 1119">Y If a definitive match cannot be made, then return the next higher level geographic centroid.</p> <p data-bbox="630 1129 1219 1161">N Disable geographic fallback feature. (default)</p>

optionName	Description
GsEnableStreetCentroid	<p>If an input street address cannot be found using the street number and name, the Enterprise Tax Module then searches the input ZIP Code or city/state for the closest match. If the Enterprise Tax Module is able to locate the street, it returns a geocode along the matched street segment rather than the geocode for the entered ZIP Code or ZIP + 4.</p> <p>When using street locator geocoding, if no exact matching house number is found, a match code of either E029 (no matching range, single street segment found), or E030 (no matching range, multiple street segment) returns. For example, if you enter Main St and there are both an E Main St and a W Main St within the input ZIP Code, then an E030 returns and the location code returned is reflective of the input ZIP Code. The location code returned begins with a "C" when matched to a single street segment, indicated by E029. The Enterprise Tax Module does not change the street name on the output address.</p> <p>Y If a street or point match cannot be made, then return a street level centroid.</p> <p>N Do not return a street level centroid if a match cannot be made. (default)</p> <p>Note: This feature should only be used for exception processing or research. It should not be used in a production process.</p>
<p>Boundary matching: These options can be set when matching to a boundary file such as SPD, IPD, PAY, Place and MCD or user-defined.</p>	
DistanceUnits	<p>Specifies the units in which to measure distance. One of the following:</p> <p>Feet Distances are measured in feet. (default)</p> <p>Meters Distances are measured in meters.</p>
DefaultBufferWidth	<p>Specifies the buffer width to use for tax district boundary files. The tax district boundary files are the Special Purpose District (SPD) file, the Insurance Premium District (IPD) file, the Payroll Tax District (PAY) file, and Place and MCD files.</p> <p>The default buffer width that you specify here can be overridden on a record-by-record basis using the BufferWidth input field.</p> <p>For more information about buffers, see Buffering on page 378.</p>

optionName	Description
DefaultUserBufferWidth	<p>Specifies the buffer width to use for user-defined boundary files. Specify the distance in the units of measurement specified in the Distance units option. For information about buffers, see Buffering on page 378. The default buffer width that you specify here can be overridden on a record-by-record basis using the BufferWidth input field.</p> <p>Note: To use buffers, the user-defined boundary file must support buffers.</p>

Output Data Options

Data options control the data returned by AssignGeoTAXInfo.

optionName	Description
GeoTAXOutputRecordType	<p>Select one or more of the following to obtain the type of data you want returned. If you do not want all of the fields in a record type returned, you can specify the individual fields to return by specifying them in the <code>OutputFields</code> option.</p> <ul style="list-style-type: none"> • C—Census • L—Latitude/Longitude • T—Tax Jurisdiction • U—User-defined boundary file • W—Payroll System Tax Codes • X—Auxiliary File • B—PB Software Sales and Use Tax Rate file <p>You can also specify one, and only one, of the following:</p> <p>I Insurance Premium Tax District (IPD)</p> <p>R Payroll Tax District (PAY)</p> <p>S Special Purpose Tax District (SPD)</p> <p>For a description of the fields in each output group, see Output on page 393.</p> <p>Note: If you specify W, also specify R to obtain the best payroll system tax code match possible.</p>
TaxKey	<p>If you use third-party tax compliance software from Vertex or Sovos, select which vendor you use. This controls the value returned in the <code>GeoTAXKey</code> output field. One of the following:</p> <p>N Do not return either the Sovos or Vertex jurisdiction codes (default).</p> <p>T Return the Sovos jurisdiction code for the address.</p> <p>V Return the Vertex jurisdiction code for the address. Select this option if you obtained a Vertex file from Pitney Bowes.</p> <p>Note: The Special Purpose District data is needed to achieve the best results from this option.</p>

optionName	Description
TaxRate	<p>Indicates the sales and use tax rate type to return or none:</p> <p>N Do not return sales and use tax rates. (default)</p> <p>G Return the General sales and use tax rates.</p> <p>A Return the Automotive sales and use tax rates.</p> <p>C Return the Construction sales and use tax rates.</p> <p>M Return the Medical sales and use tax rates.</p> <p>Note: The Special Purpose District data is needed to achieve the best results from this option.</p>
OutputFields	<p>Indicates the individual output fields you want returned. You can use this field instead of the Output Record Type to limit the output to those fields that are important to your current data needs.</p> <p>For a list of the fields included in each data type, see Output on page 393.</p>

Output Format

Output format options control how AssignGeoTAXInfo formats output data.

optionName	Description
OutputCasing	<p>Specifies the casing of these output fields: County.Name, CBSA.Name, MCD.Name, Place.Name, IPDn.DistrictName, PAYn.DistrictName, SPDn.DistrictName, and PTCn.PayrollDescription.</p> <p>One of the following:</p> <p>M Returns the output in mixed case (default). For example: Rensselaer.</p> <p>U Returns the output in upper case. For example: RENSSELAER.</p>

Output

Address Match Results

The table below lists the fields returned from the address matching and geocoding process.

Note: Fields denoted by an asterisk "*" are always included in the output regardless of whether or not you choose the associated output data options (for example, census or tax jurisdiction data output options). Contents returned when available; otherwise, left blank.

columnName	Max. Field Length with null terminator	Description
AddressMatch.DataTypeName*	20	Indicates the file from which the match was obtained. One of the following: <ul style="list-style-type: none"> • USPS • TIGER • TOMTOM - Streets • NAVTEQ - Streets • TOMTOM_POINT • CENTRUS_POINT • NAVTEQ_POINT • MASTER LOCATION - Master Location Data • STATE_FILE • USER_AUXILIARY • LANDMARK_AUXILIARY
AddressMatch.Firm*	41	The name of the business if the address is a business address.

columnName	Max. Field Length with null terminator	Description
AddressMatch.GenRC*	2	<p>General Return Code indicating the type of match.</p> <p>5 ZIP Code match</p> <p>9 ZIP+4 Code match</p> <p>A User Auxiliary file match</p> <p>C Street Centroid match</p> <p>F Geographic Fallback match</p> <p>G State-supplied file match</p> <p>I Intersection match</p> <p>L Landmark Auxiliary file match</p> <p>M Multiple match (multi-match)</p> <p>O Input Latitude/Longitude coordinates match</p> <p>P Address point match</p> <p>S Street address match</p> <p>U GeoTAX Auxiliary file match</p> <p>X Aborted processing or expired database</p> <p>Blank Did not match</p>
AddressMatch.Lastline*	61	The complete matched last address line (city, state, and postal code).
AddressMatch.LocationCode*	5	<p>The Location Code indicates the methodology used to complete the geocode and may also provide some information about the quality of the geocode.</p> <p>For the list of location codes, see Location Codes.</p>
AddressMatch.MatchCode*	5	<p>The Match Code indicates the portions of the address that matched or did not match to the reference file.</p> <p>For the list of match codes, see Match Codes.</p>
AddressMatch.NumCandidates*	2	When there are multiple equally-scored matches, returns the number of multiple match candidates found.

columnName	Max. Field Length with null terminator	Description
AddressMatch.PBKey	14	<p>A unique address identifier that is returned when an address match is made using the Master Location Database. The pbKey™ unique identifier is used as a lookup key to a GeoEnrichment database, in order to return attribute data for the match.</p> <p>The AddressMatch.PBKey field has "P" as the leading character, for example: P00001XSF1IF.</p>
AddressMatch.Urbanization*	31	Urbanization name. Used for addresses in Puerto Rico.
AddressMatch.Zip*	6	The matched address five-digit ZIP Code.
AddressMatch.Zip4*	5	The matched address four-digit ZIP Code extension.
Census.MatchCode*	2	<p>The level of match obtained against the databases.</p> <p>5 ZIP Code level match</p> <p>9 ZIP + 4 Code level match</p> <p>A User Auxiliary file match</p> <p>C Street centroid match</p> <p>F Geographic fallback match</p> <p>G State-supplied file match</p> <p>I Intersection match</p> <p>L Landmark Auxiliary file match</p> <p>M Multiple match (multi-match)</p> <p>O Input latitude/longitude coordinates match</p> <p>P Address point match</p> <p>S Street address match</p> <p>U GeoTAX Auxiliary file match</p> <p>X Aborted processing or expired database</p> <p>Blank Did not match</p>

columnName	Max. Field Length with null terminator	Description
Census.MatchLevel*	19	The level of match obtained against the databases.
		AbortedExpiredData Aborted processing or expired database
		Aux2 GeoTAX Auxiliary file match
		Auxiliary Auxiliary street match
		FallbackGeographic Geographic fallback match
		Gov State file address match
		Intersection Intersection match
		LatLonInput Input latitude/longitude coordinates match
		LandmarkAux Landmark Auxiliary file match
		MultiMatch Multiple match
		Point Address point match
		Street Street address match
		StreetCentroid Street centroid match
		ZIP ZIP Code level match
		ZIP+4 ZIP + 4 Code level match
		NoMatch Did not match

columnName	Max. Field Length with null terminator	Description
Confidence*	4	<p>Indicates the confidence in the output provided; from 0 to 100. The higher the score, the higher the confidence in the match. Calculated based on the match results for individual output fields, using the following algorithm:</p> $\text{Census.MatchCode} + \text{LatLong.StreetMatchCode} + \text{LatLong.MatchCode}$ <p>The maximum confidence score is 100, so if this calculation results in a value greater than 100, the Confidence score is returned as 100.</p> <p>The following values are used:</p> <hr/> <ul style="list-style-type: none"> • Census.MatchCode <ul style="list-style-type: none"> • 5 = 45 • 9 = 75 • A = 85 • C = 55 • F = 45 • G = 85 • I = 85 • L = 85 • M = 0 • O = 85 • P = 100 • S = 85 • U = 85 • X = 0 • null = 0 <hr/> <ul style="list-style-type: none"> • LatLong.StreetMatchCode <ul style="list-style-type: none"> • H = 5 • L = 15 • S = -10 • Z = -5 • null = 0 <hr/>

columnName	Max. Field Length with null terminator	Description
		<ul style="list-style-type: none"> • LatLong.MatchCode <ul style="list-style-type: none"> • 2 = 0 • 4 = 10 • B = 0 • C = 0 • I = 10 • L = 15 • O = 15 • R = 15 • S = -10 • T = -2 • U = 15 • Z = -5 • null = -100
County.Code*	4	Extracted from the Census.BlockCode.
County.Name*	26	Name of the county.
GNISCode*	10	Unique nine-digit Geographic Names Information System (GNIS) code.
Standardized input address fields - for field information, see Input Address on page 410.		
MCD.DistanceToBorder*	10	Returns the distance in feet between the matched address point to the polygon defined by the Cousub.txb file.

columnName	Max. Field Length with null terminator	Description
MCD.PointStatus*	2	<p>An address can be compared to a Minor Civil Division (MCD)/county subdivision file (Cousub.txt). This output field returns the result for a comparison between the matched address point to the polygon defined by the Cousub.txb file.</p> <p>For more information on buffers, see Buffering on page 378.</p> <p>Note: The buffer distance for Cousub.txb is internally set to zero and cannot be modified.</p> <p>P The point is in the polygon.</p> <p>I The point is in the buffer area inside the polygon.</p> <p>B The point is in the buffer area and outside of the polygon.</p> <p>blank Polygon not found.</p>
Place.Code*	6	<p>Five-digit Federal Information Processing Standards (FIPS) place code. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.</p>
Place.ClassCode*	3	<p>Place class code. Place class codes are used to determine the proper taxing jurisdictions</p>
Place.DistanceToBorder*	10	<p>Returns the distance between the matched address point to the polygon defined by the Place.txb file.</p>
Place.IncorporatedFlag*	8	<p>Indicates whether the address is located in an incorporated or unincorporated place. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.</p> <p>Inc Incorporated place code.</p> <p>Uninc Unincorporated place code.</p> <p>Unknown Incorporation status unknown.</p>

columnName	Max. Field Length with null terminator	Description
Place.LastAnnexedDate*	8	Last annexed date, in the format MM/YYYY, representing the month and year of the most recent boundary change or the most recent available boundary information.
Place.LastUpdatedDate*	8	Last updated date, in the format MM/YYYY, reflecting the month and year when TomTom updated the database to reflect attribute (name change, FIPS change, etc.) or boundary edits to the Place.
Place.LastVerifiedDate*	8	Last verified date, in the format MM/YYYY, representing the month and year that TomTom verified municipality change information.
Place.Name*	41	The name of the "place" where the address is located. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.
Place.PointStatus*	2	Returns the result for a comparison between the matched address point to the polygon defined by the Place.txb file. For more information on buffers, see Buffering on page 378. Note: The buffer distance for Place.txb is internally set to zero and cannot be modified. P The point is in the polygon. I The point is in the buffer area inside the polygon. B The point is in the buffer area and outside of the polygon. blank Polygon not found.
ProcessedBy*	4	Always returns GTX.
State.Abbreviation*	3	Two-character state abbreviation.

columnName	Max. Field Length with null terminator	Description
StateCode*	3	Two-digit Federal Information Processing Standards (FIPS) state code extracted from the Census.BlockCode.

Auxiliary File

The table below lists the output fields that contain Auxiliary file data. To include Auxiliary file data in the output, set `GeoTAXOutputRecordType = X`. The following table lists the output fields that contain tax jurisdiction data.

columnName	Max. Field Length with null terminator	Description
AuxiliaryData.AuxiliaryFile	301	Data retrieved as a result of an auxiliary match from the user-defined area of the auxiliary file.
AuxiliaryData.StateFile	201	Data retrieved as a result of a state match. Data content and format vary depending on the state file used.

Census

The census output fields contains census information from the U.S. Census, including Minor Civil Divisions (MCDs) and Census County Division (CCD) names and codes. MCDs are the primary political or administrative divisions of a county, representing many kinds of legal entities with a variety of governmental and administrative functions. CCDs are established in states where there are no legally established MCDs. The Census Bureau recognizes MCDs in 28 states and has established CCDs in 21 states. The District of Columbia has no primary divisions, and the city of Washington, DC is considered equivalent to an MCD for data presentation purposes.

Census data also contains the Federal Information Processing Standards (FIPS) codes for each state and county. The FIPS State Code and the FIPS County Code are both used by the Census Bureau to identify these geographic units.

The table below lists the output fields that contain census data. To include census data in the output, set `GeoTAXOutputRecordType = C`.

Note: Fields denoted by an asterisk "*" are always included in the output regardless of whether or not you choose to include census data in the output. Contents returned when available; otherwise, left blank.

columnName	Max. Field Length with null terminator	Description
Census.Block	4	Census Block ID.
Census.BlockGroup	2	Census Block Group code.
Census.MatchCode*	2	The level of match obtained against the databases. <ul style="list-style-type: none"> 5 ZIP Code level match 9 ZIP + 4 Code level match A User Auxiliary file match C Street centroid match F Geographic fallback match G State-supplied file match I Intersection match L Landmark Auxiliary file match M Multiple match (multi-match) O Input latitude/longitude coordinates match P Address point match S Street address match U GeoTAX Auxiliary file match X Aborted processing or expired database Blank Did not match

columnName	Max. Field Length with null terminator	Description
Census.MatchLevel*	19	The level of match obtained against the databases. AbortedExpiredData Aborted processing or expired database Aux2 GeoTAX Auxiliary file match Auxiliary Auxiliary street match FallbackGeographic Geographic fallback match Gov State file address match Intersection Intersection match LatLonInput Input latitude/longitude coordinates match LandmarkAux Landmark Auxiliary file match MultiMatch Multiple match Point Address point match Street Street address match StreetCentroid Street centroid match ZIP ZIP Code level match ZIP+4 ZIP + 4 Code level match NoMatch Did not match
Census.Tract	7	Six-digit tract number extracted from the Census.BlockCode.
County.Code*	4	Extracted from the Census.BlockCode.
County.Name*	26	Name of the county.
MCD.Code	6	Minor Civil Division/Census County Division (MCD/CCD) Code.
MCD.Name	41	Minor Civil Division/Census County Division (MCD/CCD) name.

columnName	Max. Field Length with null terminator	Description
MCD.PointStatus*	2	<p>An address can be compared to a Minor Civil Division (MCD)/county subdivision file (Cousub.txt). This output field returns the result for a comparison between the matched address point to the polygon defined by the Cousub.txb file.</p> <p>For more information on buffers, see Buffering on page 378.</p> <p>Note: The buffer distance for Cousub.txb is internally set to zero and cannot be modified.</p> <p>P The point is in the polygon.</p> <p>I The point is in the buffer area inside the polygon.</p> <p>B The point is in the buffer area and outside of the polygon.</p> <p>blank Polygon not found.</p>
MCD.DistanceToBorder*	10	Returns the distance in feet between the matched address point to the polygon defined by the Cousub.txb file.
MCD.Confidence	4	Provides the percentage overlap of the geocode to the MCD polygon layer. The returned percentage value describes the probability that the point falls in the MCD.
CBSA.Code	6	Core Based Statistical Area (CBSA) code.
CBSA.Name	76	Core Based Statistical Area (CBSA) name.

columnName	Max. Field Length with null terminator	Description
CBSA.MetroFlag	2	Indicates if the CBSA is a "Metropolitan Statistical Area" or a "Micropolitan Statistical Area". Y Metropolitan Statistical Area - A Core Based Statistical Area associated with at least one urbanized area that has a population of at least 50,000. The Metropolitan Statistical Area comprises the central county or counties containing the core, plus adjacent outlying counties having a high degree of social and economic integration with the central county as measured through commuting. N Micropolitan Statistical Area - A Core Based Statistical Area associated with at least one urban cluster that has a population of at least 10,000, but less than 50,000. The Micropolitan Statistical Area comprises the central county or counties containing the core, plus adjacent outlying counties having a high degree of social and economic integration with the central county as measured through commuting.
CBSAD.Code	6	Core Based Statistical Area Division (CBSAD) code.
CBSAD.Name	73	Core Based Statistical Area Division (CBSAD) name.
CSA.Code	4	Combined Statistical Area (CSA) code.
CSA.Name	78	Combined Statistical Area (CSA) name.
State.Abbreviation*	3	Two-character state abbreviation.
StateCode*	3	Two-digit Federal Information Processing Standards (FIPS) state code extracted from the Census.BlockCode.

Latitude/Longitude

The table below lists the output fields that contain latitude and longitude data. Latitude/Longitude data contains the coordinates for the address and additional information about how the latitude and

longitude for the address was determined. To include latitude/longitude data in the output, set `GeoTAXOutputRecordType = L`.

Note: Fields denoted by an asterisk "*" are always included in the output regardless of whether or not you choose to include latitude/longitude data in the output. Contents returned when available; otherwise, left blank.

columnName	Max. Field Length with null terminator	Description
Latitude	8	Seven-digit number in degrees and calculated to four decimal places (in the format you specified).
Latitude.Directional	2	Latitude directional. N North S South
LatLong	23	Returned latitude/longitude, in the format you specified (up to 22 alphanumeric characters).

columnName	Max. Field Length with null terminator	Description
LatLong.MatchCode	2	Latitude/Longitude General Return Code. Denotes the level for which the geocode was determined.
	2	ZIP + 2 centroid
	4	ZIP + 4 Code centroid
	B	Block group centroid
	C	City centroid
	I	Intersection
	L	Match using the Landmark Auxiliary file
	O	Latitude/longitude was input
	R	Address-level based on street address
	S	State centroid
	T	Census tract centroid
	U	Address-level match using the GeoTAX Auxiliary file
	Z	ZIP Code centroid based on a five-digit ZIP code
	null	No latitude/longitude determined

columnName	Max. Field Length with null terminator	Description
		If <code>AddressMatch.GenRC</code> is "P" (point match), then the following are possible values:
	0	Latitude/Longitude coordinates from User Dictionary.
	2	Latitude/Longitude coordinates from Parcel Centroid.
	4	Latitude/Longitude coordinates from Address Point.
	5	Latitude/Longitude coordinates from Structure Centroid.
	7	Latitude/Longitude coordinates from manually-placed Point.
	8	Latitude/Longitude coordinates from Front Door Point.
	9	Latitude/Longitude coordinates from Driveway Offset Point.
	A	Latitude/Longitude coordinates from Street Access Point.
	B	Latitude/Longitude coordinates from Base Parcel Point.
	C	Latitude/longitude coordinates from Backfill Address Point.
	D	Latitude/longitude coordinates from Virtual Address Point.
	E	Latitude/longitude coordinates from Interpolated Address Point.

columnName	Max. Field Length with null terminator	Description
LatLong.MatchLevel*	14	A description of the value returned in the <code>LatLong.MatchCode</code> field.
		ZIP+2 ZIP + 2 centroid
		ZIP+4 ZIP + 4 centroid
		Block Block group centroid
		CityCentroid City centroid
		Intersection Intersection match
		LandmarkAux Match using the Landmark Auxiliary file
		LatLonInput Input Latitude/Longitude coordinates was used
		Rooftop Exact address match
		StateCentroid State centroid
		Tract Census tract centroid
		Auxiliary Address-level match using the GeoTAX Auxiliary file
		ZIP ZIP Code centroid
		Point Point-level match. One of the following: <ul style="list-style-type: none"> • User Dictionary • Parcel Centroid • Address Point • Structure Centroid • Manually-placed Point • Front Door Point • Driveway Offset Point • Street Access Point • Base Parcel Point • Backfill Address Point • Virtual Address Point • Interpolated Address Point

columnName	Max. Field Length with null terminator	Description
LatLong.StreetMatchCode*	2	Output street address return code. H House number not found on street L Latitude/longitude not determined on auxiliary match S Street not found in ZIP Code Z ZIP Code not found in street address database N Street-level matching option not selected null The street was successfully matched
LatLong.StreetMatchLevel*	16	Street level match used to determine the latitude/longitude FullMatch Successful match HouseNotFound House number not found on street LatLongNotFound Latitude/longitude not determined on auxiliary match StreetNotFound Street not found in ZIP Code ZipNotFound ZIP Code not found in street address database NotUsed Street-level matching option not selected
Longitude	8	Seven-digit number in degrees and calculated to four decimal places (in the format specified).
Longitude.Directional	2	Longitude directional. E East W West

Input Address

AssignGeoTAXInfo always returns the input address as part of the output. Any changes to the address information resulting from the address cleansing process will be returned to these fields.

columnName	Max. Field Length with null terminator	Description
AddressLine1	101	Input address line 1.
AddressLine2	101	Input address line 2.
AddressLine3	101	Input address line 3.
AddressLine4	101	Input address line 4.
City	51	Input address city.
Country	25	Input address country.
FirmName	101	Input address firm name.
PostalCode	10	Input address postal code
StateProvince	51	Input address state.

Parsed Elements

The parsed elements output fields contain standard street address line information as individual units, such as street suffixes (for example AVE, ST, or RD) and leading directionals (for example N and SE).

To include parsed elements in the output, assign the desired output fields to the `OutputFields` parameter.

columnName	Max. Field Length with null terminator	Description
AddressMatch.UnitType	5	The type of unit, such as apartment, suite, or lot.
AddressMatch.UnitNumber	12	Apartment number. For example, 123 E Main St APT 3
AddressMatch.HouseNumber	12	Building number for the address.
AddressMatch.PreDirectional	3	Leading directional. For example, 123 E Main St Apt 3
AddressMatch.Street	41	The name of the street, not including any directionals or suffixes. For example, the word "Main" in this address: 123 E Main St Apt 3
AddressMatch.StreetType	5	The street type of the matched location. For example, AVE for Avenue.
AddressMatch.PostDirectional	3	Street directional that follows the street name. For example, the "N" in this address: 456 Washington N .

Payroll System Tax Code

The table below lists the output fields that contain Payroll System Tax Code (PTC) data. For more information about payroll tax districts, see [AssignGeoTAXInfo](#) on page 375. To include this data in the output, set `GeoTAXOutputRecordType = W`.

Note: AssignGeoTAXInfo returns up to six payroll tax codes per address.

columnName	Max. Field Length with null terminator	Description
NumberPTCsFound	2	The number of payroll tax codes found for this address.

columnName	Max. Field Length with null terminator	Description
PTCn.MatchCode	2 per PTC	<p>Indicates the level of match obtained for the address. In order from most specific match to least, the possible match codes are:</p> <ul style="list-style-type: none"> P The address was matched to a specific Payroll District ID. This is the most specific match. G The address was matched to a GNIS Code. F The address was matched to a county's FIPS code. S The address was matched to a state's FIPS code. This is the least specific match.
PTCn.PayrollCode	16 per PTC	A code that represents a taxing authority in a payroll application. This is a user-defined code. The specific codes are determined by the payroll application that utilizes the data returned by AssignGeoTAXInfo.
PTCn.PayrollDescription	41 per PTC	A description of the purpose of this payroll code.
PTCn.PayrollFlag	7 per PTC	A user-defined flag from the PTC database.
StateCounty	33	The state abbreviation and county name.

Tax Jurisdiction

Tax jurisdiction data contains information about the "place" for the location. A "place" is a geographic area defined on the basis of population criteria that vary by state; or, an area recognized as significant because it is located in an incorporated municipality. Places are used to determine tax jurisdiction.

The table below lists the output fields that contain tax jurisdiction data. To include tax jurisdiction data in the output, set `GeoTAXOutputRecordType = T`.

Note: Fields denoted by an asterisk "*" are always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output. Contents returned when available; otherwise, left blank.

columnName	Max. Field Length with null terminator	Description
Confidence.SurfaceType	3	<p>Indicates the confidence surface type. Setting a non-zero buffer width enables confidence generation. To determine a confidence level, a confidence surface is first generated. The confidence surface provides the smallest possible area wherein an address is likely to be located.</p> <p>0 Undefined</p> <p>1 The search failed - the address was not found.</p> <p>2 Intersection confidence surface generated.</p> <p>3 Interpolated street segment.</p> <p>4 Point-level match.</p> <p>5 State confidence surface generated.</p> <p>6 County confidence surface generated.</p> <p>7 City confidence surface generated.</p> <p>8 Reserved</p> <p>9 A ZIP Code confidence surface generated.</p> <p>10 A ZIP+2 confidence surface generated.</p> <p>11 A ZIP+4 confidence surface generated.</p> <p>12 Reserved</p> <p>13 A street centroid confidence surface generated.</p>
GeoTAXKey	10	<p>The value in this field varies depending on the option you specified in the <code>TaxKey</code> option:</p> <p>If you specified <code>T</code>, <code>GeoTAXKey</code> contains the proprietary codes used in Sovos tax compliance software. You can use this code in your Sovos application to find out the tax rate for the jurisdiction. The Sovos jurisdiction code formats are as follows:</p> <ul style="list-style-type: none"> • Sovos SUT - 2-digit SUT state code, 5-digit ZIP Code, 2-digit SUT geocode • Sovos TWE - variable-length TWE geocode <p>If you specified <code>V</code>, <code>GeoTAXKey</code> contains the proprietary Vertex[®] jurisdiction code (comprised of a two-digit Vertex[®] state code, three-digit FIPS county code, and four-digit Vertex[®] city code). You can use this code in your Vertex[®] application to find out the tax rate for the jurisdiction.</p>

columnName	Max. Field Length with null terminator	Description
GeoTAXKey.MatchCode	2	<p>Return code denoting the level of match obtained against the PBS Vertex or Sovos cross reference files.</p> <p>E Exact match using five fields: FIPS state code, FIPS county code, FIPS or GNIS place code, ZIP Code, and FIPS place name.</p> <p>P Partial match using four fields: FIPS state code, FIPS county code, FIPS or GNIS place code, and ZIP Code.</p> <p>A Alternate match using two fields: ZIP Code, FIPS place name.</p> <p>N Record is default coded based on valid state code.</p> <p>null No matching record found.</p>
GeoTAXKey.MatchLevel	12	<p>A description of the value returned in the <code>GeoTAXKey.MatchCode</code> field.</p> <p>Exact Exact match. See description in <code>GeoTAXKey.MatchCode</code>.</p> <p>Partial Partial match. See description in <code>GeoTAXKey.MatchCode</code>.</p> <p>Alternate Alternate match. See description in <code>GeoTAXKey.MatchCode</code>.</p> <p>DefaultCode Record is default coded. See description in <code>GeoTAXKey.MatchCode</code>.</p> <p>NoMatch No matching record found.</p>
GNISCode *	10	Unique nine-digit Geographic Names Information System (GNIS) code.
Place.ClassCode *	3	Place class code. Place class codes are used to determine the proper taxing jurisdictions

columnName	Max. Field Length with null terminator	Description
Place.Code*	6	Five-digit Federal Information Processing Standards (FIPS) place code. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.
Place.IncorporatedFlag*	8	Indicates whether the address is located in an incorporated or unincorporated place. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality. Inc Incorporated place code. Uninc Unincorporated place code. Unknown Incorporation status unknown.
Place.LastAnnexedDate*	8	Last annexed date, in the format MM/YYYY, representing the month and year of the most recent boundary change or the most recent available boundary information.
Place.LastUpdatedDate*	8	Last updated date, in the format MM/YYYY, reflecting the month and year when TomTom updated the database to reflect attribute (name change, FIPS change, etc.) or boundary edits to the Place.
Place.LastVerifiedDate*	8	Last verified date, in the format MM/YYYY, representing the month and year that TomTom verified municipality change information.
Place.Name*	41	The name of the "place" where the address is located. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.

columnName	Max. Field Length with null terminator	Description
Place.PointStatus*	2	<p>Returns the result for a comparison between the matched address point to the polygon defined by the Place.txb file.</p> <p>For more information on buffers, see Buffering on page 378.</p> <p>Note: The buffer distance for Place.txb is internally set to zero and cannot be modified.</p> <p>P The point is in the polygon.</p> <p>I The point is in the buffer area inside the polygon.</p> <p>B The point is in the buffer area and outside of the polygon.</p> <p>blank Polygon not found.</p>
Place.DistanceToBorder*	10	Returns the distance between the matched address point to the polygon defined by the Place.txb file.
Place.Confidence	4	Provides the percentage overlap of the geocode to the Place polygon layer. The returned percentage value describes the probability that the point falls in the specified Place.

User-Defined Boundary File

The table below lists the output fields that contain data returned from user-defined boundary files. To include this data in the output, set `GeoTAXOutputRecordType = U`.

Note: AssignGeoTAXInfo can return up to 10 user-defined areas for each input address.

columnName	Max. Field Length with null terminator	Description
NumberUserBoundariesFound	3	The number of user-defined polygons found for the address.
UserBoundary <i>n</i> .BoundaryDescription	51 per User Boundary	A description of the polygon.

columnName	Max. Field Length with null terminator	Description
UserBoundary n .BoundaryID	11 per User Boundary	The ID of the polygon as specified in the user-defined boundary file.
UserBoundary n .BufferRelation	2 per User Boundary	<p>Indicates where in the polygon the address resides in relation to the edge of the area. Buffer width is specified by the option <code>DefaultUserBufferWidth</code> or by the input field <code>BufferWidth</code> .</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The address is inside the polygon at a distance from the edge that is greater than the specified buffer width. I The address is inside the polygon but is close to the edge. B The address is outside the polygon but is close to the edge. <p>For more information, see Buffering on page 378.</p>
UserBoundary n .DistanceToBorder	10 per User Boundary	Indicates the distance from the address to the border of the polygon. The distance is in the units specified by the option <code>DistanceUnits</code> .
UserBoundary n .SupplementalBoundaryID	11 per User Boundary	A supplemental ID as specified in the user-defined boundary file.
UserBoundary n .BoundaryConfidence	4 per User Boundary	Provides the percentage overlap of the geocode to the User-defined boundary polygon layer. The returned percentage value describes the probability that the point falls in the User-defined boundary area.

Insurance Premium Tax Districts

The table below lists the output fields that contain Insurance Premium Tax Districts (IPD) data. To include IPD data in the output, set `GeoTAXOutputRecordType = I`.

Note: `AssignGeoTAXInfo` returns multiple districts for IPDs, SPDs, and PAYS.

columnName	Max. Field Length with null terminator	Description
NumberIPDsFound	3	The number of Insurance Premium Tax Districts found for the address
IPD <i>n</i> .BoundaryBuffer.BufferRelation	2 per IPD	<p>Indicates where in the district the address resides in relation to the edge of the district. Buffer width is specified by the option <code>DefaultBufferWidth</code> or by the input field <code>BufferWidth</code>.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The address is inside the district at a distance from the edge that is greater than the specified buffer width. I The address is inside the district but is close to the edge. This indicates that the address is in the buffer area. B The address is outside the district but is close to the edge. This indicates that the address is in the buffer area. <p>For more information, see Buffering on page 378.</p>
IPD <i>n</i> .BoundaryBuffer.DistanceToBorder	10 per IPD	Indicates the distance from the address to the border of the district.
IPD <i>n</i> .BoundaryConfidence	4 per IPD	Provides the percentage overlap of the geocode to the IPD boundary polygon layer. The returned percentage value describes the probability that the point falls in the IPD boundary area.
IPD <i>n</i> .DistrictID	11 per IPD	IPD ID.
IPD <i>n</i> .DistrictName	61 per IPD	IPD name.
IPD <i>n</i> .DistrictType	7 per IPD	IPD district type.
IPD <i>n</i> .UpdateDate	7 per IPD	IPD update date (MMYYYY).

columnName	Max. Field Length with null terminator	Description
IPD <i>n</i> .VersionDate	7 per IPD	IPD compiled date (MMYYYYY).
IPD <i>n</i> .Notes	21 per IPD	Tax code descriptions. For example: 01, 33, A, B
IPD <i>n</i> .ChangeDate	7 per IPD	IPD change date.
IPD <i>n</i> .EffectiveDate	7 per IPD	MMDDYY - Identifies when district becomes active - State supplied For example: 010108
IPD <i>n</i> .ExpirationDate	7 per IPD	MMDDYY - Identifies when district becomes inactive - State supplied For example: 063009
IPD <i>n</i> .FireRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPD <i>n</i> .FireFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semi colon as a delimiter. 3;7 = "3% or 7%"
IPD <i>n</i> .CasualtyRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPD <i>n</i> .CasualtyFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"

columnName	Max. Field Length with null terminator	Description
IPDn.VehicleRate	21 per IPD	Format is dependent on associated flag Possible Values: .13, 15.00 or 3;7
IPDn.VehicleFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.MarineRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.MarineFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.HealthRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.HealthFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.LifeRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.LifeFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"

columnName	Max. Field Length with null terminator	Description
IPDn.OtherRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.OtherFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.MinimumRate	21 per IPD	Format is dependent on associated flag Possible Values: .13, 15.00 or 3;7
IPDn.MinimumFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"

Payroll Tax Districts

The table below lists the output fields that contain Payroll Tax District (PAY) data. For more information on payroll tax districts, see [AssignGeoTAXInfo](#) on page 375. To include this data in the output, set `GeoTAXOutputRecordType = R`.

Note: `AssignGeoTAXInfo` returns multiple districts for IPDs, SPDs, and PAYs.

columnName	Max. Field Length with null terminator	Description
NumberPAYsFound	3	Number of PAYs returned.

columnName	Max. Field Length with null terminator	Description
PAYn.BoundaryBuffer.BufferRelation	2 per PAY	<p>Indicates where in the district the address resides in relation to the edge of the district. Buffer width is specified by the option <code>DefaultBufferWidth</code> or by the input field <code>BufferWidth</code>.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The address is inside the district at a distance from the edge that is greater than the specified buffer width. I The address is inside the district but is close to the edge. This indicates that the address is in the buffer area. B The address is outside the district but is close to the edge. This indicates that the address is in the buffer area. <p>For more information, see Buffering on page 378.</p>
PAYn.BoundaryBuffer.DistanceToBorder	10 per PAY	Indicates the distance from the address to the border of the district. The distance is in the units specified by the option <code>DistanceUnits</code> .
PAYn.BoundaryConfidence	4 per PAY	Provides the percentage overlap of the geocode to the PAY boundary polygon layer. The returned percentage value describes the probability that the point falls in the PAY boundary area.
PAYn.DistrictID	11 per PAY	PAY district ID.
PAYn.DistrictName	61 per PAY	PAY district name.
PAYn.DistrictType	7 per PAY	PAY district type.
PAYn.ID	11 per PAY	PAY ID.

columnName	Max. Field Length with null terminator	Description
PAYn.MunicipalEMSTax	2 per PAY	<p>PAY municipality emergency municipal services tax.</p> <p>The values for Pennsylvania are:</p> <p>Y Levies the tax</p> <p>N Does not levy the tax</p> <p>All other states are null.</p>
PAYn.MunicipalIncomeTax	2 per PAY	<p>PAY municipality income tax.</p> <p>The values for Pennsylvania are:</p> <p>R Resident</p> <p>N Non-resident</p> <p>B Both</p> <p>X None</p> <p>All other states are null.</p>
PAYn.SchoolDistrictEMSTax	2 per PAY	<p>PAY school district emergency municipal services tax.</p> <p>The Values for Pennsylvania are:</p> <p>Y Levies the tax</p> <p>N Does not levy the tax</p> <p>All other states are null.</p>
PAYn.SchoolDistrictIncomeTax	2 per PAY	<p>PAY school district income tax.</p> <p>The values for Pennsylvania are:</p> <p>R Resident</p> <p>N Non-resident</p> <p>B Both</p> <p>X N</p> <p>The values for Ohio are:</p> <p>R Resident</p> <p>X None</p> <p>All other states are null.</p>

Special Purpose Tax Districts

The table below lists the output fields that contain Special Purpose Tax Districts (SPD) data. For more information on special purpose tax districts, see [AssignGeoTAXInfo](#) on page 375. To include this data in the output, set `GeoTAXOutputRecordType = S`.

Note: `AssignGeoTAXInfo` returns multiple districts for IPDs, SPDs, and PAYS.

columnName	Max. Field Length with null terminator	Description
NumberSPDsFound	3	Number of SPDs returned.
SPDn.BoundaryBuffer.BufferRelation	2 per SPD	<p>Indicates where in the district the address resides in relation to the edge of the district. Buffer width is specified by the option <code>DefaultBufferWidth</code> or by the input field <code>BufferWidth</code>.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The address is inside the district at a distance from the edge that is greater than the specified buffer width. I The address is inside the district but is close to the edge. This indicates that the address is in the buffer area. B The address is outside the district but is close to the edge. This indicates that the address is in the buffer area. <p>For more information, see Buffering on page 378.</p>
SPDn.BoundaryBuffer.DistanceToBorder	10 per SPD	Indicates the distance from the address to the border of the district. The distance is in the units specified by the option <code>DistanceUnits</code> .
SPDn.BoundaryConfidence	4 per SPD	Provides the percentage overlap of the geocode to the SPD boundary polygon layer. The returned percentage value describes the probability that the point falls in the SPD boundary area.
SPDn.CompiledDate	7 per SPD	SPD compiled date.

columnName	Max. Field Length with null terminator	Description
SPDn.DistrictCode	4 per SPD	3-digit district type code.
SPDn.DistrictName	61 per SPD	SPD name.
SPDn.DistrictNumber	6 per SPD	SPD district number.
SPDn.EffectiveDate	7 per SPD	SPD effective date.
SPDn.UpdateDate	7 per SPD	SPD update date.
SPDn.VersionDate	7 per SPD	SPD version date.

Sales and Use Tax Rates

The table below lists the output fields that contain the sales and use tax rate data.

To include tax rate data in the output, set `GeoTAXOutputRecordType = B`.

To select the tax rate type, set `TaxRate` to one of the following:

- N** Do not return sales and use tax rates. (default)
- G** Return the General sales and use tax rates.
- A** Return the Automotive sales and use tax rates.
- C** Return the Construction sales and use tax rates.
- M** Return the Medical sales and use tax rates.

Note: You must be a licensed user of the Pitney Bowes Sales and Use Tax Rate file to use this feature.

The following table describes the Sales and Use Tax Rate output fields.

columnName	Max. Field Length with null terminator	Description
TaxRate.RC	2	<p>Tax Rate return code denoting the level of match obtained against the Pitney Bowes Sales and Use Tax Rate file:</p> <p>E Exact match, using all 5 fields</p> <p>P Partial match, using 4 fields</p> <p>A Alternate match, using 3 fields</p> <p>N Record is default-coded based on valid state code.</p> <p>Blank No matching PB Software Sales and Use Tax Rate record found.</p>
Municipal.SalesTaxRate	11	Municipality sales tax rate for the selected tax rate type.
County.SalesTaxRate	11	County sales tax rate for the selected tax rate type.
State.SalesTaxRate	11	State sales tax rate for the selected tax rate type.
SPDn.SalesTaxRate	11 per SPD	Sales tax rate for up to 10 Special Purpose Districts (SPD).
TaxRate.SalesTotal	11	The sum of the individual Municipal, County, State and SPD sales tax rates.
Municipal.UseTaxRate	11	Municipality use tax rate for the selected tax rate type.
County.UseTaxRate	11	County use tax rate for the selected tax rate type.
State.UseTaxRate	11	State use tax rate for the selected tax rate type.
SPDn.UseTaxRate	11 per SPD	Use tax rate for up to 10 Special Purpose Districts (SPD).

columnName	Max. Field Length with null terminator	Description
TaxRate.UseTotal	11	The sum of the individual Municipal, County, State and SPD use tax rates.

Error Reporting

The table below defines the error reporting output fields.

Note: Fields denoted by an asterisk "*" are always included in the output. Contents returned when available; otherwise, left blank.

columnName	Max. Field Length with null terminator	Description																														
GTX.ErrorCode*	3	<p>This field contains a return code if the GeoTAX engine experiences an abnormal termination.</p> <p>Note: This field contains the same set of codes returned by the standalone GeoTAX software and is intended for users who have migrated from GeoTAX to Spectrum™ Technology Platform.</p> <p>The first character indicates the file (or set of files affected).</p> <table border="0"> <tr><td>Blank</td><td>Matcher terminated normally</td></tr> <tr><td>A</td><td>User Auxiliary file problem</td></tr> <tr><td>CE</td><td>coubsub.txb file problem</td></tr> <tr><td>CI</td><td>Confidence engine problem</td></tr> <tr><td>D</td><td>Boundary file</td></tr> <tr><td>F</td><td>User-defined boundary file problem</td></tr> <tr><td>G</td><td>Address Matching engine problem</td></tr> <tr><td>L</td><td>Licensing problem</td></tr> <tr><td>S</td><td>State file problem</td></tr> <tr><td>U</td><td>GeoTAX Auxiliary file problem</td></tr> <tr><td>X</td><td>Combination of Street and state file problem</td></tr> <tr><td>Z</td><td>zip.gsb file problem</td></tr> </table> <p>The second position is one of the following:</p> <table border="0"> <tr><td>E</td><td>Fatal issue, program terminating</td></tr> <tr><td>F</td><td>Expired database</td></tr> <tr><td>I</td><td>Informational</td></tr> </table>	Blank	Matcher terminated normally	A	User Auxiliary file problem	CE	coubsub.txb file problem	CI	Confidence engine problem	D	Boundary file	F	User-defined boundary file problem	G	Address Matching engine problem	L	Licensing problem	S	State file problem	U	GeoTAX Auxiliary file problem	X	Combination of Street and state file problem	Z	zip.gsb file problem	E	Fatal issue, program terminating	F	Expired database	I	Informational
Blank	Matcher terminated normally																															
A	User Auxiliary file problem																															
CE	coubsub.txb file problem																															
CI	Confidence engine problem																															
D	Boundary file																															
F	User-defined boundary file problem																															
G	Address Matching engine problem																															
L	Licensing problem																															
S	State file problem																															
U	GeoTAX Auxiliary file problem																															
X	Combination of Street and state file problem

CalculateDistance

CalculateDistance takes two sets of latitude/longitude coordinates as input, calculates the distance between the coordinates, and returns the distance between the two points.

CalculateDistance is part of the Enterprise Tax Module.

Input

CalculateDistance takes latitude and longitude information as input.

The table below defines the CalculateDistance input data.

columnName	Description
FirstLatitude	Latitude of the first point for which you want distance returned.
FirstLatitude.Directional	First latitude directional. N North S South
FirstLongitude	Longitude of the first point for which you want distance returned.

columnName	Description
FirstLongitude.Directionals	First longitude directional. E East W West
SecondLatitude	Latitude of the second point for which you want distance returned.
SecondLatitude.Directionals	Second latitude directional. N North S South
SecondLongitude	Longitude of the second point for which you want distance returned.
SecondLongitude.Directionals	Second longitude directional. E East W West

Options

The table below defines the output data and format options.

optionName	Description
LatLongFormat	Indicates the format of the input latitude/longitude. The options are: DegMinSec For example 90 00 00N180 00 00W. PreZero Decimal degrees using directional indicator (no decimal point). For example, 090000000N180000000W. (default) PreZeroDecimal Decimal degrees using directional indicator. For example, 090.000000N180.000000W. Decimal Decimal degrees using signed latitude/longitude. For example, 90.000000-180.000000. DecimalAssumed Decimal degrees using signed latitude/longitude (no decimal point). For example, 90000000-180000000.

optionName	Description
ReturnUnits	Indicates the measurement units returned for distance calculation: <ul style="list-style-type: none"> • Feet • Km • Meters • Miles (default)

Output

CalculateDistance always returns the Confidence field to indicate the confidence in the output provided.

If CalculateDistance fails to process the data, it returns the fields Status, Status.Code, and Status.Descriptions. These fields provide information on why CalculateDistance failed to process the data. Some examples of failures are your license expired or you did not select any output record types and fields for CalculateDistance to return. The following table provides the record-level qualifiers and data outputs for CalculateDistance.

columnName	Max. Field Length with null terminator	Description
Distance	9	Distance between the two input coordinates in the units of measurement that you specified.
Status	2	Reports the success or failure of the match attempt: null Success F Failure
Status.Code	2	Reason for failure or error. If Status = F, Status.Code = Failure.
Status.Description	64	Description of the problem. If Status = F, Status.Description = Unable to compute distance.

ReverseGeoTAXInfoLookup

ReverseGeoTAXInfoLookup allows latitude/longitude coordinates to be supplied as input and identifies the tax districts that apply to the given coordinate. Specifically, ReverseGeoTAXInfoLookup can return the following information about a location:

- FIPS state codes and county codes
- State and county names
- MCD codes and names
- Place codes and names
- Boundary file districts
- Cross-reference tax keys
- The relationship of the input coordinates to user-defined polygons
- Sales and use tax rates, if licensed for the Pitney Bowes Sales and Use Tax Rate File

ReverseGeoTAXInfoLookup optionally includes enhanced tax jurisdiction information for a location, including:

- **Insurance premium districts**—Areas designated for the collection of taxes imposed on insurance policy premiums, based on the policy holder's address. Insurance premium districts are created by state governments.
- **Payroll tax districts**—Areas designated for the collection of taxes imposed on employers to support state or local government facilities and services, based on the employee's and/or employer's address. Examples include taxes collected for districts to pay for schools, police, or other services. Payroll tax districts are created by state or local governments.
- **Payroll system tax codes**—Codes that represent specific jurisdictions that collect payroll tax. Using payroll system tax codes has advantages over using the payroll tax district information returned by ReverseGeoTAXInfoLookup:
 - ReverseGeoTAXInfoLookup uses an additional database to determine payroll tax codes, resulting in more accurate payroll tax determination.
 - Many payroll systems use specific codes to determine withholding amounts. Since you can customize the payroll tax codes returned by ReverseGeoTAXInfoLookup, you can set up a process where ReverseGeoTAXInfoLookup returns the exact payroll tax codes required by your payroll system, instead of returning jurisdictional IDs that must then be translated into the codes used by your system.
- **Special purpose tax districts**—Areas designated for the collection of taxes imposed on residents to support specialized services for residents of the district, based on the resident's address. Examples include services such as sewer service, transit service, or water resources. Special purpose tax districts are created by legislative action, court action, or public referendums. This optional information requires the use of boundary files which require an additional license. Contact your Pitney Bowes sales representative for more information.

Using the optional Pitney Bowes Sales and Use Tax Rate file, ReverseGeoTAXInfoLookup includes tax rate data for a location, including:

Tax rate type:

- General
- Automotive
- Medical
- Construction

Sales and/or use tax rates for:

- State
- County
- Municipality
- Up to 10 SPDs
- Total Rate - the sum of the individual state, county, municipality and SPD rates.

Required input format

The required format for the input coordinates is as follows:

columnName	Format
InputLatitude	00.000000 or without the decimal point 00000000
InputLongitude	000.000000 or without the decimal point 000000000, or 00.000000 or without the decimal point 00000000

ReverseGeoTAXInfoLookup is part of the Enterprise Tax Module.

Geocoding Options

Reverse geocoding information lookup is the process of taking an input latitude/longitude coordinate and returning jurisdictional tax information. The geocoding options specify the distance units and buffer distance to use when matching to a boundary file.

optionName	Description
Database.GTX	Select the database resource to use in the reverse geocoding lookup process.

optionName	Description
------------	-------------

Boundary matching: The following options can be set when matching to a boundary file such as SPD, IPD, PAY, Place and MCD, or user-defined.

DistanceUnits	Specifies the units in which to measure distance. One of the following:				
	<table border="0"> <tr> <td>Feet</td> <td>Distances are measured in feet. (default)</td> </tr> <tr> <td>Meters</td> <td>Distances are measured in meters.</td> </tr> </table>	Feet	Distances are measured in feet. (default)	Meters	Distances are measured in meters.
Feet	Distances are measured in feet. (default)				
Meters	Distances are measured in meters.				

Default buffer widths

DefaultBufferWidth	<p>Specifies the buffer width to use for tax district boundary files. The tax district boundary files are the Special Purpose Districts (SPD) file, the Insurance Premium Districts (IPD) file, the Payroll Tax Districts (PAY) file, and Place and MCD files.</p> <p>The default buffer width that you specify here can be overridden on a record-by-record basis using the BufferWidth input field.</p> <p>For more information about buffers, see Buffering on page 378.</p>
--------------------	---

DefaultUserBufferWidth	<p>Specifies the buffer width to use for user-defined boundary files. The distance is in the units of measurement specified in the Distance units option. For information about buffers, see Buffering on page 378. The default buffer width that you specify here can be overridden on a record-by-record basis using the BufferWidth input field.</p> <p>Note: To use buffers, the user-defined boundary file must support buffers.</p>
------------------------	---

Output Data Options

Data options control the data returned by ReverseGeoTAXInfoLookup.

optionName	Description
GeoTAXOutputRecordType	<p>Select one or more of the following to obtain the type of data you want returned. ReverseGeoTAXInfo Lookup groups the output fields into record types. If you do not want all of the fields in a record type returned, do not select the check box, and list only those fields you want returned in <code>OutputFields</code>.</p> <ul style="list-style-type: none"> • C—Census • T—Tax Jurisdiction • U—User-defined boundary file • W—Payroll System Tax Codes • X—Auxiliary File • B—PB Software Sales and Use Tax Rate file <p>You can also specify one, and only one, of the following:</p> <p>I Insurance Premium Tax District (IPD)</p> <p>R Payroll Tax District (PAY)</p> <p>S Special Purpose Tax District (SPD)</p> <p>For a description of the fields in each output group, see Output on page 442.</p> <p>Note: If you specify W, also specify R to obtain the best payroll system tax code match possible.</p>
TaxKey	<p>If you integrate ReverseGeoTAXInfo Lookup with third-party tax compliance software from Vertex or Sovos, select which vendor you use. This controls the value returned in the <code>GeoTAXKey</code> output field. One of the following:</p> <p>N Do not return either the Sovos or Vertex jurisdiction codes (default).</p> <p>T Return the Sovos jurisdiction code for the address.</p> <p>V Return the Vertex jurisdiction code for the address. Select this option if you obtained a Vertex file from Pitney Bowes.</p>
TaxRate	<p>Select the desired Sales tax rate type or none:</p> <p>N Do not return sales tax rates. (default)</p> <p>G Return the General sales tax rates.</p> <p>A Return the Automotive sales tax rates.</p> <p>C Return the Construction sales tax rates.</p> <p>Return the Medical sales tax rates.</p>

optionName	Description
OutputFields	<p>Indicates the individual output fields you want returned. You can use this field instead of the Output Record Type to limit the output to those fields that are important to your current data needs.</p> <p>For a list of the fields included in each data type, see Output on page 442.</p>

Output Format

Output format options control how ReverseGeoTAXInfo Lookup formats output data.

optionName	Description
OutputCasing	<p>Specifies the casing of these output fields: County.Name, MCD.Name, Place.Name, IPDn.DistrictName, PAYn.DistrictName, SPDn.DistrictName, and PTCn.PayrollDescription.</p> <p>One of the following:</p> <p>M Returns the output in mixed case (default). For example: Boulder.</p> <p>U Returns the output in upper case. For example: BOULDER.</p>

Output

Auxiliary File

The table below lists the output fields that contain Auxiliary file data. To include Auxiliary file data in the output, set `GeoTAXOutputRecordType = X`. The following table lists the output fields that contain tax jurisdiction data.

columnName	Max. Field Length with null terminator	Description
AuxiliaryData.AuxiliaryFile	301	Data retrieved as a result of an auxiliary match from the user-defined area of the auxiliary file.
AuxiliaryData.StateFile	201	Data retrieved as a result of a state match. Data content and format vary depending on the state file used.

Census

The census output fields contains census information from the U.S. Census, including Minor Civil Divisions (MCDs) and Census County Division (CCD) names and codes. MCDs are the primary political or administrative divisions of a county, representing many kinds of legal entities with a variety of governmental and administrative functions. CCDs are established in states where there are no legally established MCDs. The Census Bureau recognizes MCDs in 28 states and has established CCDs in 21 states. The District of Columbia has no primary divisions, and the city of Washington, DC is considered equivalent to an MCD for data presentation purposes.

Census data also contains the Federal Information Processing Standards (FIPS) codes for each state and county. The FIPS State Code and the FIPS County Code are both used by the Census Bureau to identify these geographic units.

The following table lists the output fields that contain census data. To include census data in the output, set `GeoTAXOutputRecordType = C`.

columnName	Max. Field Length with null terminator	Description
County.Code	4	<p>Three-digit Federal Information Processing Standards (FIPS) county code extracted from the Census.BlockCode.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include census data in the output.</p>
County.Name	26	<p>Name of the county.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include census data in the output.</p>
MCD.Code	6	Minor Civil Division/Census County Division (MCD/CCD) Code.
MCD.Name	41	Minor Civil Division/Census County Division (MCD/CCD) name.
MCD.PointStatus	2	<p>An address can be compared to a Minor Civil Division (MCD)/county subdivision file (Cousub.txt). This output field returns the result for a comparison between the matched geocode location to the polygon defined by the Cousub.txt file.</p> <p>For more information about buffers, see Buffering on page 378.</p> <p>Note: The buffer distance for Cousub.txt is internally set to zero and cannot be modified.</p> <p>P The point is in the polygon.</p> <p>I The point is in the buffer area inside the polygon.</p> <p>B The point is in the buffer area and outside of the polygon.</p> <p>blank Polygon not found.</p>
MCD.DistanceToBorder	10	Returns the distance in feet between the matched address point to the polygon defined by the Cousub.txt file.

columnName	Max. Field Length with null terminator	Description
StateCode	3	Two-digit Federal Information Processing Standards (FIPS) state code extracted from the Census.BlockCode. Note: This field is always included in the output regardless of whether or not you choose to include census data in the output.

Input Latitude/Longitude

ReverseGeoTAXInfoLookup always returns the input coordinates as part of the output. The input latitude/longitude fields are returned as input from the data. ReverseGeoTAXInfoLookup does not change these input values.

columnName	Max. Field Length with null terminator	Description
InputLatitude	12	Input latitude.
InputLongitude	12	Input longitude.

Payroll System Tax Code

The following table lists the output fields that contain Payroll System Tax Code (PTC) data. For more information on payroll tax districts, see [Reverse GeoTAX Info Lookup](#). To include this data in the output, set `GeoTAXOutputRecordType = W`.

Note: ReverseGeoTAXInfoLookup returns up to six payroll tax codes per input location.

columnName	Max. Field Length with null terminator	Description
NumberPTCsFound	2	The number of payroll system tax codes found for this location.

columnName	Max. Field Length with null terminator	Description
PTCn.MatchCode	2 per PTC	<p>Indicates the level of match obtained for the location. In order from most specific match to least, the possible match codes are:</p> <ul style="list-style-type: none"> P The address was matched to a specific Payroll District ID. This is the most specific match. G The address was matched to a GNIS Code. F The address was matched to a county's FIPS code. S The address was matched to a state's FIPS code. This is the least specific match.
PTCn.PayrollCode	16 per PTC	A code that represents a taxing authority in a payroll application. This is a user-defined code. The specific codes are determined by the payroll application that utilizes the data returned by ReverseGeoTAXInfo Lookup.
PTCn.PayrollDescription	41 per PTC	A description of the purpose of this payroll code.
PTCn.PayrollFlag	7 per PTC	A user-defined flag from the PTC database.
StateCounty	33	The state abbreviation and county name.

Tax Jurisdiction

Tax jurisdiction data contains information about the "place" for the location. A "place" is a geographic area defined on the basis of population criteria that vary by state; or, an area recognized as significant because it is located in an incorporated municipality. Places are used to determine tax jurisdiction.

The following table lists the output fields that contain tax jurisdiction data. To include tax jurisdiction data in the output, set `GeoTAXOutputRecordType = T`.

columnName	Max. Field Length with null terminator	Description
GeoTAXKey	10	<p>The value in this field varies depending on the option you specified in the <code>TaxKey</code> option:</p> <p>If you specified <code>T</code>, <code>GeoTAXKey</code> contains the proprietary codes used in Sovos tax compliance software. You can use this code in your Sovos application to find out the tax rate for the jurisdiction. The Sovos jurisdiction code formats are as follows:</p> <ul style="list-style-type: none"> • Sovos SUT - 2-digit SUT state code, 5-digit ZIP Code, 2-digit SUT geocode • Sovos TWE - variable-length TWE geocode <p>If you specified <code>V</code>, <code>GeoTAXKey</code> contains the proprietary Vertex[®] jurisdiction code (comprised of a two-digit Vertex[®] state code, three-digit FIPS county code, and four-digit Vertex[®] city code). You can use this code in your Vertex[®] application to find out the tax rate for the jurisdiction.</p>
GeoTAXKey.MatchCode	2	<p>Return code denoting the level of match obtained against the PBS Vertex or Sovos cross reference files.</p> <p>E Exact match using five fields: FIPS state code, FIPS county code, FIPS or GNIS place code, ZIP Code, and FIPS place name.</p> <p>P Partial match using four fields: FIPS state code, FIPS county code, FIPS or GNIS place code, and ZIP Code.</p> <p>A Alternate match using two fields: ZIP Code, FIPS place name.</p> <p>N Record is default coded based on valid state code.</p> <p>null No matching record found.</p>

columnName	Max. Field Length with null terminator	Description
GeoTAXKey.MatchLevel	12	<p>A description of the value returned in the GeoTAXKey.MatchCode field.</p> <p>Exact Exact match. See description in GeoTAXKey.MatchCode.</p> <p>Partial Partial match. See description in GeoTAXKey.MatchCode.</p> <p>Alternate Alternate match. See description in GeoTAXKey.MatchCode.</p> <p>DefaultCode Record is default coded. See description in GeoTAXKey.MatchCode.</p> <p>NoMatch No matching record found.</p>
GNISCode	10	<p>Unique nine-digit Geographic Names Information System (GNIS) code.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include census data in the output.</p>
Place.ClassCode	3	<p>Place class code. Place class codes are used to determine the proper taxing jurisdictions</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output.</p>
Place.Code	6	<p>Five-digit Federal Information Processing Standards (FIPS) place code. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output.</p>

columnName	Max. Field Length with null terminator	Description
Place.IncorporatedFlag	8	<p>Indicates whether the address is located in an incorporated or unincorporated place. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output.</p> <p>Inc Incorporated place code.</p> <p>Uninc Unincorporated place code.</p> <p>Unknown Incorporation status unknown.</p>
Place.LastAnnexedDate	8	<p>Last annexed date, in the format MM/YYYY, representing the month and year of the most recent boundary change or the most recent available boundary information.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output.</p>
Place.LastUpdatedDate	8	<p>Last updated date, in the format MM/YYYY, reflecting the month and year when TomTom updated the database to reflect attribute (name change, FIPS change, etc.) or boundary edits to the Place.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output.</p>
Place.LastVerifiedDate	8	<p>Last verified date, in the format MM/YYYY, representing the month and year that TomTom verified municipality change information.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output.</p>

columnName	Max. Field Length with null terminator	Description
Place.Name	41	<p>The name of the "place" for the location. A "place" is a geographic area defined on the basis of population criteria that vary by state. Or, an area recognized as significant because it is located in an incorporated municipality.</p> <p>Note: This field is always included in the output regardless of whether or not you choose to include tax jurisdiction data in the output.</p>
Place.PointStatus	2	<p>Returns the result for a comparison between the matched geocode location to the polygon defined by the Place.txb file. For more information on buffers, see Buffering on page 378.</p> <p>P The point is in the polygon.</p> <p>I The point is in the buffer area inside the polygon.</p> <p>B The point is in the buffer area and outside of the polygon.</p> <p>blank Polygon not found.</p>
Place.DistanceToBorder	10	Returns the distance in feet between the matched address point to the polygon defined by the Place.txb file.

User-Defined Boundary File

The following table lists the output fields that contain data returned from user-defined boundary files. To include this data in the output, set `GeoTAXOutputRecordType = U`.

Note: ReverseGeoTAXInfoLookup can return up to 10 user-defined areas for each input location.

columnName	Max. Field Length with null terminator	Description
NumberUserBoundariesFound	3	The number of user-defined polygons found for the address.

columnName	Max. Field Length with null terminator	Description
UserBoundary n .BoundaryDescription	51 per User Boundary	A description of the polygon.
UserBoundary n .BoundaryID	11 per User Boundary	The ID of the polygon as specified in the user-defined boundary file.
UserBoundary n .BufferRelation	2 per User Boundary	<p>Indicates where in the polygon the location resides in relation to the edge of the area. Buffer width is specified by the option <code>DefaultUserBufferWidth</code> or by the input field <code>BufferWidth</code>.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The geocode is inside the polygon at a distance from the edge that is greater than the specified buffer width. I The geocode is inside the polygon but is close to the edge. This indicates that the address is in the buffer area. B The geocode is outside the polygon but is close to the edge. This indicates that the address is in the buffer area. <p>For more information, see Buffering on page 378.</p>
UserBoundary n .DistanceToBorder	10 per User Boundary	Indicates the distance in feet from the input location to the border of the polygon.
UserBoundary n .SupplementalBoundaryID	11 per User Boundary	A supplemental ID as specified in the user-defined boundary file.

Insurance Premium Tax Districts

The following table lists the output fields that contain Insurance Premium Tax Districts (IPD) data. For more information on insurance premium tax districts, see [ReverseGeoTAXInfoLookup](#) on page 437. To include IPD data in the output, set `GeoTAXOutputRecordType = I`.

Note: ReverseGeoTAXInfoLookup returns multiple districts for IPDs, SPDs, and PAYs.

columnName	Max. Field Length with null terminator	Description
NumberIPDsFound	3	The number of Insurance Premium Tax Districts found for the location.
IPD <i>n</i> .BoundaryBuffer.BufferRelation	2 per IPD	<p>Indicates where in the district the location resides in relation to the edge of the district. Buffer width is specified by the option <code>DefaultBufferWidth</code> or by the input field <code>BufferWidth</code>.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The location is inside the district at a distance from the edge that is greater than the specified buffer width. I The location is inside the district but is close to the edge. This indicates that the location is in the buffer area. B The location is outside the district but is close to the edge. This indicates that the location is in the buffer area. <p>For more information, see Buffering on page 378.</p>
IPD <i>n</i> .BoundaryBuffer.DistanceToBorder	10 per IPD	Indicates the distance in feet from the location to the border of the district.
IPD <i>n</i> .DistrictID	11 per IPD	IPD ID.
IPD <i>n</i> .DistrictName	61 per IPD	IPD name.
IPD <i>n</i> .DistrictType	7 per IPD	IPD district type.
IPD <i>n</i> .UpdateDate	7 per IPD	IPD update date (MMYYYY).
IPD <i>n</i> .VersionDate	7 per IPD	IPD compiled date (MMYYYY).

columnName	Max. Field Length with null terminator	Description
IPDn.Notes	21 per IPD	Tax code descriptions. For example: 01, 33, A, B
IPDn.ChangeDate	7 per IPD	IPD change date.
IPDn.EffectiveDate	7 per IPD	MMDDYY - Identifies when district becomes active - State supplied For example: 010108
IPDn.ExpirationDate	7 per IPD	MMDDYY - Identifies when district becomes inactive - State supplied For example: 063009
IPDn.FireRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.FireFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semi colon as a delimiter. 3;7 = "3% or 7%"
IPDn.CasualtyRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.CasualtyFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.VehicleRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7

columnName	Max. Field Length with null terminator	Description
IPDn.VehicleFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.MarineRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.MarineFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.HealthRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.HealthFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.LifeRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPDn.LifeFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPDn.OtherRate	21 per IPD	Format is dependent on associated flag Possible Values: .13, 15.00 or 3;7

columnName	Max. Field Length with null terminator	Description
IPD <i>n</i> .OtherFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"
IPD <i>n</i> .MinimumRate	21 per IPD	Format is dependent on associated flag For example: .13, 15.00 or 3;7
IPD <i>n</i> .MinimumFlag	6 per IPD	P - Percentage; .1 = 10%, .0575 = 5.75% F - Flat Fee dollar amount M - Multiple Percentages has a semicolon as a delimiter. 3;7 = "3% or 7%"

Payroll Tax Districts

The following table lists the output fields that contain Payroll Tax District (PAY) data. For more information on payroll tax districts, see [Reverse GeoTAX Info Lookup](#). To include this data in the output, set `GeoTAXOutputRecordType = R`.

Note: ReverseGeoTAXInfoLookup returns multiple districts for IPDs, SPDs, and PAYs.

columnName	Max. Field Length with null terminator	Description
NumberPAYsFound	3	Number of payroll tax districts found for the location.

columnName	Max. Field Length with null terminator	Description
PAYn.BoundaryBuffer.BufferRelation	2 per PAY	<p>Indicates where in the district the location resides in relation to the edge of the district. Buffer width is specified by the option <code>DefaultBufferWidth</code> or by the input field <code>BufferWidth</code>.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The location is inside the district at a distance from the edge that is greater than the specified buffer width. I The location is inside the district but is close to the edge. This indicates that the location is in the buffer area. B The location is outside the district but is close to the edge. This indicates that the location is in the buffer area. <p>For more information, see Buffering on page 378.</p>
PAYn.BoundaryBuffer.DistanceToBorder	10 per PAY	Indicates the distance in feet from the location to the border of the district.
PAYn.DistrictID	11 per PAY	PAY district ID.
PAYn.DistrictName	61 per PAY	PAY district name.
PAYn.DistrictType	7 per PAY	PAY district type.
PAYn.ID	11 per PAY	PAY ID.
PAYn.MunicipalEMSTax	2 per PAY	<p>PAY municipality emergency municipal services tax.</p> <p>The values for Pennsylvania are:</p> <ul style="list-style-type: none"> Y Levies the tax N Does not levy the tax <p>All other states are null.</p>

columnName	Max. Field Length with null terminator	Description
PAYn.MunicipalIncomeTax	2 per PAY	<p>PAY municipality income tax.</p> <p>The values for Pennsylvania are:</p> <p>R Resident</p> <p>N Non-resident</p> <p>B Both</p> <p>X None</p> <p>All other states are null.</p>
PAYn.SchoolDistrictEMSTax	2 per PAY	<p>PAY school district emergency municipal services tax.</p> <p>The Values for Pennsylvania are:</p> <p>Y Levies the tax</p> <p>N Does not levy the tax</p> <p>All other states are null.</p>
PAYn.SchoolDistrictIncomeTax	2 per PAY	<p>PAY school district income tax.</p> <p>The values for Pennsylvania are:</p> <p>R Resident</p> <p>N Non-resident</p> <p>B Both</p> <p>X N</p> <p>The values for Ohio are:</p> <p>R Resident</p> <p>X None</p> <p>All other states are null.</p>

Special Purpose Tax Districts

The following table lists the output fields that contain Special Purpose Tax Districts (SPD) data. For more information on special purpose tax districts, see [Reverse GeoTAX Info Lookup](#). To include this data in the output, set `GeoTAXOutputRecordType = S`.

Note: ReverseGeoTAXInfoLookup returns multiple districts for IPDs, SPDs, and PAYs.

columnName	Max. Field Length with null terminator	Description
NumberSPDsFound	3	Number of Special Purpose Tax Districts found for the location.
SPD <i>n</i> .BoundaryBuffer.BufferRelation	2 per SPD	<p>Indicates where in the district the location resides in relation to the edge of the district. Buffer width is specified by the option <code>DefaultBufferWidth</code> or by the input field <code>BufferWidth</code>.</p> <p>One of the following:</p> <ul style="list-style-type: none"> P The location is inside the district at a distance from the edge that is greater than the specified buffer width. I The location is inside the district but is close to the edge. This indicates that the location is in the buffer area. B The location is outside the district but is close to the edge. This indicates that the location is in the buffer area. <p>For more information, see Buffering on page 378.</p>
SPD <i>n</i> .BoundaryBuffer.DistanceToBorder	10 per SPD	Indicates the distance in feet from the address to the border of the district.
SPD <i>n</i> .CompiledDate	7 per SPD	SPD compiled date.
SPD <i>n</i> .DistrictCode	4 per SPD	3-digit district type code.
SPD <i>n</i> .DistrictName	61 per SPD	SPD name.
SPD <i>n</i> .DistrictNumber	6 per SPD	SPD district number.
SPD <i>n</i> .EffectiveDate	7 per SPD	SPD effective date.

columnName	Max. Field Length with null terminator	Description
SPDn.UpdateDate	7 per SPD	SPD update date.
SPDn.VersionDate	7 per SPD	SPD version date.

Sales and Use Tax Rates

The table below lists the output fields that contain the sales and use tax rate data.

To include tax rate data in the output, set `GeoTAXOutputRecordType = B`.

To select the tax rate type, set `TaxRate` to one of the following:

- N** Do not return sales and use tax rates. (default)
- G** Return the General sales and use tax rates.
- A** Return the Automotive sales and use tax rates.
- C** Return the Construction sales and use tax rates.
- M** Return the Medical sales and use tax rates.

Note: You must be a licensed user of the Pitney Bowes Sales and Use Tax Rate file to use this feature.

The following table describes the Sales and Use Tax Rate output fields.

columnName	Max. Field Length with null terminator	Description
TaxRate.RC	2	Tax Rate return code denoting the level of match obtained against the Pitney Bowes Sales and Use Tax Rate file: <ul style="list-style-type: none"> E Exact match, using all 5 fields P Partial match, using 4 fields A Alternate match, using 3 fields N Record is default-coded based on valid state code. Blank No matching PB Software Sales and Use Tax Rate record found.

columnName	Max. Field Length with null terminator	Description
Municipal.SalesTaxRate	11	Municipality sales tax rate for the selected tax rate type.
County.SalesTaxRate	11	County sales tax rate for the selected tax rate type.
State.SalesTaxRate	11	State sales tax rate for the selected tax rate type.
SPDn.SalesTaxRate	11 per SPD	Sales tax rate for up to 10 Special Purpose Districts (SPD).
TaxRate.SalesTotal	11	The sum of the individual Municipal, County, State and SPD sales tax rates.
Municipal.UseTaxRate	11	Municipality use tax rate for the selected tax rate type.
County.UseTaxRate	11	County use tax rate for the selected tax rate type.
State.UseTaxRate	11	State use tax rate for the selected tax rate type.
SPDn.UseTaxRate	11 per SPD	Use tax rate for up to 10 Special Purpose Districts (SPD).
TaxRate.UseTotal	11	The sum of the individual Municipal, County, State and SPD use tax rates.

Error Reporting

The table below defines the error reporting output fields.

columnName	Max. Field Length with null terminator	Description																														
GTX.ErrorCode	3	<p>This field contains a return code if the GeoTAX engine experiences an abnormal termination.</p> <p>Note: This field contains the same set of codes returned by the standalone GeoTAX software and is intended for users who have migrated from GeoTAX to Spectrum™ Technology Platform.</p> <p>The first character indicates the file (or set of files affected).</p> <table border="0"> <tr><td>Blank</td><td>Matcher terminated normally</td></tr> <tr><td>A</td><td>User Auxiliary file problem</td></tr> <tr><td>CE</td><td>coubsub.txb file problem</td></tr> <tr><td>CI</td><td>Confidence engine problem</td></tr> <tr><td>D</td><td>Boundary file</td></tr> <tr><td>F</td><td>User-defined boundary file problem</td></tr> <tr><td>G</td><td>Address Matching engine problem</td></tr> <tr><td>L</td><td>Licensing problem</td></tr> <tr><td>S</td><td>State file problem</td></tr> <tr><td>U</td><td>GeoTAX Auxiliary file problem</td></tr> <tr><td>X</td><td>Combination of Street and state file problem</td></tr> <tr><td>Z</td><td>zip.gsb file problem</td></tr> </table> <p>The second position is one of the following:</p> <table border="0"> <tr><td>E</td><td>Fatal issue, program terminating</td></tr> <tr><td>F</td><td>Expired database</td></tr> <tr><td>I</td><td>Informational</td></tr> </table>	Blank	Matcher terminated normally	A	User Auxiliary file problem	CE	coubsub.txb file problem	CI	Confidence engine problem	D	Boundary file	F	User-defined boundary file problem	G	Address Matching engine problem	L	Licensing problem	S	State file problem	U	GeoTAX Auxiliary file problem	X	Combination of Street and state file problem	Z	zip.gsb file problem	E	Fatal issue, program terminating	F	Expired database	I	Informational

GTX.WarnCode	3	This field contains warning codes returned by the GeoTAX engine. It is blank if no warnings were issued. A value of <code>WN</code> indicates a database will expire next month. Note: This field contains the same set of codes returned by the standalone GeoTAX software and is intended for users who have migrated from GeoTAX to Spectrum™ Technology Platform.

columnName	Max. Field Length with null terminator	Description
GTX.WarnDescription	81	<p>A text description of any warnings returned by the GeoTAX engine.</p> <p>Note: This field contains the same set of descriptions returned by the standalone GeoTAX software and is intended for users who have migrated from GeoTAX to Spectrum™ Technology Platform.</p>

Summary Reports

Assign GeoTAX Info Summary Report

A pre-configured report can be generated for a job. This is supported for a job run through either the Assign GeoTAX Info or the Reverse GeoTAX Info Lookup stage. The report summarizes general information about the job, such as the settings, number of records processed, performance statistics, and the database used. It also contains detailed statistics about the results of the job.

The summary report contains the following sections for Assign GeoTAX Info and Reverse GeoTAX Info Lookup except where noted.

Job Summary

This section contains information about the software and databases used for the job.

- **Software Version**—The version of the underlying software used by AssignGeoTAXInfo. Note that this is not the same as the Spectrum™ Technology Platform version number.
- **Input Mode**—The type of input data.
 - `Address Input`— Indicates the data was generated from a job using the AssignGeoTAXInfo stage.
 - `Latitude-Longitude Input`—Indicates the data was generated from a job using the ReverseGeoTAXInfo Lookup stage.
- **Street Database Vendor**—The street database vendor used for matching.
- **Street Database Version**—The version of the Street portion of the Master File database. For information on the Master File, see [Enterprise Tax Databases](#) on page 370.
- **Cross Reference Database Version**—The version of the cross-reference database used in this job. Cross-reference databases are used to determine jurisdiction codes for use with third-party tax software. For information on the Cross Reference databases, see [Enterprise Tax Databases](#) on page 370.

Address Matching Summary

Note: This section of the summary is not provided for jobs using the Reverse GeoTAX Info Lookup stage.

This section describes the input address match counts.

- **Total Match Attempts**—Address matches attempted in this job.
- **Total Records Matched**—Input addresses that were matched to known locations.
- **Total Unmatched Records**—Input addresses that could not be matched to known addresses.

Address Matching Levels

Note: This section of the summary is not provided for jobs using the Reverse GeoTAX Info Lookup stage.

This section lists the counts and percentages of the types of address matches performed by Assign GeoTAX Info.

- **User-Defined Auxiliary File Matches**—The number of address matches made to the user-defined auxiliary file. For information on a user-defined auxiliary file, see [Enterprise Tax Module](#) on page 369.
- **GeoTAX Auxiliary File Matches**—The number of address matches made to the GeoTAX Auxiliary file. For information on the GeoTAX Auxiliary file, see [Enterprise Tax Module](#) on page 369.
- **State File Matches**—The number of address matches made to a state-supplied files.
- **Landmark Auxiliary Matches**—The number of address matches made to the Landmark Auxiliary file.
- **Point-Level Matches**—The number of address matches made using point-level data.
- **Address-Level Matches**—The number of addresses matches made to an approximate location on a street segment.
- **Street Intersection-Level Matches**—The number of address matches made to a street intersection.
- **Street-Centroid Level Matches**—The number of address matches that were made along the matched street segment.
- **ZIP + 4-Level Matches**—The number of address matches made to an area defined by a ZIP + 4 Code.
- **ZIP-Level Matches**—The number of address matches made to an area defined by a 5-digit ZIP Code.
- **Fallback Geographic Matches**—The number of address matches that were made to a city or state centroid.

Standardized Address Quality

This section describes the changes that were made to addresses in order to validate them.

- **Original Address Unchanged**—None of the address elements were changed to obtain a match.
- **Original Last Unchanged**—The last line (city, state, ZIP Code) was unchanged but other elements were changed to obtain a match.

- **Corrected state abbreviation**—The state abbreviation was corrected to obtain a match. For example, ROCHESTER NY changed to ROCHESTER MN.
- **Corrected prefix direction**—The predirectional of a street name was changed to obtain a match. For example, E MAIN ST changed to W MAIN ST.
- **Corrected street name**—The name of the street was changed to obtain a match. For example, MAIN ST changed to MAINE ST.
- **Corrected street suffix**—The street suffix was changed to obtain a match. For example, MAIN ST changed to MAIN AVE.
- **Corrected city name**—The name of the city was corrected to obtain a match. For example, LOS ANGLES changed to LOS ANGELES.
- **Corrected postfix direction**—The postdirectional of a street was changed to obtain a match. For example, MAIN ST NW changed to MAIN ST SW.
- **Corrected ZIP code**—The ZIP Code as corrected to obtain a match. For example: 1071 MAPLE LN BATAVIA IL 49423 Changed to: 1071 MAPLE LN BATAVIA IL 60510.
- **Corrected ZIP + 4 code**—The four digits that appear after the "-" in a ZIP + 4 were corrected to obtain a match. For example, 60510 changed to 60510-1135.

Unmatched Address Records

This section lists the number of unmatched addressees and the reasons why the addresses were not matched. For information about these codes, see [Match Codes for No Match - Definitions for "Ennn" return codes](#).

Latitude/Longitude Matching

Note: This section of the summary is not provided for jobs using the Reverse GeoTAX Info Lookup stage.

This section lists the counts and percentages of the types of geocodes determined by Assign GeoTAX Info. This section describes how precisely AssignGeoTAXInfo determined latitude/longitude coordinates of an address. These counts are based on match codes. For more information, on match codes, see [Latitude/Longitude](#) on page 405.

- **Total Lat/Long Matches**—Addresses that AssignGeoTAXInfo determined latitude/longitude coordinates. Addresses included in this count have any value other than null in the **LatLong.MatchCode** output field.
- **Total Lat/Long Unmatched**—Addresses that AssignGeoTAXInfo was unable to determine latitude/longitude. Addresses included in this count have a value of null in the **LatLong.MatchCode** output field.
- **GeoTAX Auxiliary-level Matches**—The count of geocodes determined using the GeoTAX Auxiliary File.
- **Landmark-Level Matches**—The count of geocodes determined using the Landmark Auxiliary File.
- **Point-level Matches**—The count of geocodes that represent the actual location of the address using point-level data. This is the most accurate type of geocode.

- **Address-Level Matches**—The count of geocodes made to the actual location of the address. Addresses included in this count have a value of R in the **LatLong.MatchCode** output field.
- **ZIP + 4-Level Matches**—The count of geocodes made that represent the center of the ZIP + 4 code in which the address is located. Addresses included in this count have a value of 4 in the **LatLong.MatchCode** output field.
- **Census Block Group-Level Matches**—The count of geocodes that represent the center of the address's Census block group. Addresses included in this count have a value of B in the **LatLong.MatchCode** output field.
- **ZIP + 2-Level Matches**—The count of geocodes that represent the center of the address's ZIP + 2 code. Addresses included in this count have a value of 2 in the **LatLong.MatchCode** output field.
- **Census Tract-Level Matches**—The count of geocodes that represent the center of the address's Census tract. Addresses included in this count have a value of T in the **LatLong.MatchCode** output field.
- **ZIP Code-Level Matches**—The count of geocodes that represent the center of the ZIP Code in which the address is located. Addresses included in this count have a value of Z or 5 in the **LatLong.MatchCode** output field.
- **City-Centroid Level Matches**—The count of geocodes that represent the center of a city.
- **State-Centroid Level Matches**—The count of geocodes that represent the center of a state.

Census Matching

This section describes how precisely AssignGeoTAXInfo determined an address location within the statistical areas defined by the U.S. Census.

- **Census Tracts Determined**—Addresses that AssignGeoTAXInfo determined a census tract. Addresses included in this count have a value in the **Census.Tract** output field.
- **Census Tracts Not Determined**—Addresses that AssignGeoTAXInfo was unable to determine a census tract. Addresses included in this count have no value in the **Census.Tract** output field.
- **State Codes Determined**—Addresses that AssignGeoTAXInfo determined a state. Addresses included in this count have a value in the **StateCode** output field.
- **State Codes Not Determined**—Addresses that AssignGeoTAXInfo did not determine a state. Addresses included in this count have no value in the **StateCode** output field.
- **County Codes Determined**—Addresses that AssignGeoTAXInfo determined a county. Addresses included in this count have a value in the **County.Code** output field.
- **County Codes Not Determined**—Addresses that AssignGeoTAXInfo did not determine a county. Addresses included in this count have no value in the **County.Code** output field.
- **Census Block Group Determined**—Addresses that AssignGeoTAXInfo determined a block group. Addresses included in this count have a value in the **Census.BlockCode** output field.
- **Census Block Groups Not Determined**—Addresses that AssignGeoTAXInfo was unable to determine a block group. Addresses included in this count have no value in the **Census.BlockCode** output field.
- **CBSA Codes Determined**—Addresses that AssignGeoTAXInfo determined a core based statistical area (CBSA). Addresses included in this count have a value in the **CBSA.Code** output field.

- **CBSA Codes Not Determined**—Addresses that AssignGeoTAXInfo did not determine a core based statistical area (CBSA). Addresses included in this count have no value in the **CBSA.Code** output field.
- **MCD/CCD Codes Determined**—Addresses that AssignGeoTAXInfo determined a Minor Civil Division/Census County Division code. Addresses included in this count have a value in the **MCD.Code** output field.
- **MCD/CCD Codes Not Determined**—Addresses that AssignGeoTAXInfo was unable to determine a Minor Civil Division/Census County Division code. Addresses included in this count have no value in the **MCD.Code** output field.

Tax Jurisdiction Matching

This section describes how accurately AssignGeoTAXInfo determined an address place. The place information is used to determine tax jurisdictions.

- **Place Codes Determined**—Addresses that AssignGeoTAXInfo determined a place code. Addresses included in this count have a value in the **Place.Code** output field.
- **Place Codes Not Determined**—Addresses that AssignGeoTAXInfo was unable to determine a place code. Addresses included in this count have no value in the **Place.Code** output field.
- **Place Names Determined**—Addresses that AssignGeoTAXInfo determined a place name. Addresses included in this count have a value in the **Place.Name** output field.
- **Place Class Codes Determined**—Addresses that AssignGeoTAXInfo determined a place code. Addresses included in this count have a value in the **Place.ClassCode** output field.
 - **Incorporated Places**—Addresses that reside in an incorporated municipality. Addresses included in this count have a value of Inc in the **Place.IncorporatedFlag** output field.
 - **Unincorporated Places**—Addresses that reside in a place that is not an incorporated municipality. Addresses included in this count have a value of Uninc in the **Place.IncorporatedFlag** output field.
- **Place Last Annexed Date Found**—Places that AssignGeoTAXInfo determined the last date of annexation. Addresses included in this count have a value in the **Place.LastAnnexedDate** output field.
- **Place Last Verified Date Found**—Places that AssignGeoTAXInfo determined the last date that the place data was verified by the data provider. Addresses included in this count have a value in the **Place.LastVerifiedDate** output field.
- **Place Last Updated Date Found**—Places that AssignGeoTAXInfo determined the date that the place data was last updated by the data provider. Addresses included in this count have a value in the **Place.LastUpdatedDate** output field.

GeoTAX Key Matching

This section describes how accurately AssignGeoTAXInfo determined GeoTAX keys. A GeoTAX key is used in conjunction with software from a third party to determine tax rates. If you do not choose to return a GeoTAX key, this section is blank.

- **GeoTAX Cross Reference Match Attempts**—Addresses that AssignGeoTAXInfo attempted to match to an cross reference file. These files are used to determine codes for use with third party tax software.
- **Unsuccessful GeoTAX Cross Reference Matches**—Addresses that AssignGeoTAXInfo attempted to determine a code but was unable.
- **Successful GeoTAX Cross Reference Matches**—Addresses that AssignGeoTAXInfo determined a code using a cross reference file. Addresses included in this count have a value in the **GeoTAXKey** output field.
 - **Exact Matches Achieved**—Addresses matched exactly to a GeoTAX key. For more information about GeoTAX key match levels, see the description of the GeoTAXKey.MatchCode output field under [Tax Jurisdiction](#) on page 413.
 - **Partial Matches Achieved**—Addresses partially matched to a GeoTAX key. For more information about GeoTAX key match levels, see the description of the GeoTAXKey.MatchCode output field under [Tax Jurisdiction](#) on page 413.
 - **Alternate Matches Achieved**—Addresses matched to a GeoTAX key using an alternate, less accurate, method. For more information about GeoTAX key match levels, see the description of the GeoTAXKey.MatchCode output field under [Tax Jurisdiction](#) on page 413.
 - **Default Matches Achieved**—Addresses matched to a GeoTAX key only at the state level. For more information about GeoTAX key match levels, see the description of the GeoTAXKey.MatchCode output field under [Tax Jurisdiction](#) on page 413.

Tax District Matching

This section describes the number of matches to specific types of tax districts. The specific type of tax districts displayed in this section vary based the district type selected in the **Tax district** field.

Note: If you specify a buffer width in the **Tax district buffer** field, a single location could be counted in more than one district due to buffering. For more information about buffering, see [Buffering](#) on page 378.

- **Successful Payroll Tax File Matches**—Addresses that AssignGeoTAXInfo determined a payroll tax code using the Payroll Tax District boundary file. For more information on Payroll Tax Districts, see [Payroll Tax Districts](#) on page 422.
- **Unsuccessful Payroll Tax File Matches**—Addresses that AssignGeoTAXInfo was unable to determine a payroll tax code using the Payroll Tax District boundary file. For more information on Payroll Tax Districts, see [Payroll Tax Districts](#) on page 422.
- **Locations in Special Purpose Districts**—Addresses that reside in at least one Special Purpose District. For more information on Special Purpose Districts, see [Special Purpose Tax Districts](#) on page 425.
- **Locations in 1 Special Purpose District**—Addresses that reside in a single Special Purpose District. Addresses included in this count have a value of 1 in the **NumberSPDsFound** output field.
- **Locations in 2 Special Purpose Districts**—Addresses that reside in two overlapping Special Purpose Districts. Addresses included in this count have a value of 2 in the **NumberSPDsFound** output field.

- **Locations in 3 or 4 Special Purpose Districts**—Addresses that reside in three or four overlapping Special Purpose Districts. Addresses included in this count have a value of 3 or 4 in the **NumberSPDsFound** output field.
- **Locations in 5+ Special Purpose Districts**—Addresses that reside in five or more overlapping Special Purpose Districts. Addresses included in this count have a value of 5 or greater in the **NumberSPDsFound** output field.
- **Locations in User-Defined Districts**—Addresses that reside in at least one user-defined district. For more information on user-defined districts, see [User-Defined Boundary File](#) on page 417.
- **Locations in 1 User District**—Addresses that reside in one user-defined district. Addresses included in this count have a value of 1 in the **NumberUserBoundariesFound** output field.
- **Locations in 2 User Districts**—Addresses that reside in two overlapping user-defined districts. Addresses included in this count have a value of 2 in the **NumberUserBoundariesFound** output field.
- **Locations in 3+ User Districts**—Addresses that reside in three or more overlapping user-defined districts. Addresses included in this count have a value of 3 in the **NumberUserBoundariesFound** output field.

Generating a Summary Report

This procedure describes how to add a report to a job.

1. In Enterprise Designer, on the bottom left side of the window under Palette, click **Reports**. A list of available reports appears.
2. Drag the Assign GeoTAX Info icon to the canvas. You do not need to connect the icon to anything.
3. Double-click the report.
4. Select the stages that you want to contribute to the report.
5. If you want an output format other than PDF, such as html or txt, perform these steps:
 - a) Click the **Parameters** tab.
 - b) Clear the **Use default reporting options** check box and select the desired output format.
6. Click **OK**. On the toolbar, click the **Run Current Flow** (arrow) button. The `Execution Details` window displays.
7. When the Status field shows `succeeded`, under Reports, click **AssignGeoTAXInfo**. The Summary Report displays.

Match and Location Codes

Match Codes

Match Codes indicate the portions of the address that matched or did not match to the reference file. If a match could not be made, the Match Code begins with "E" and the remaining digits indicate

why the address did not match (see [Match Codes for No Match - Definitions for "Ennn" return codes](#) on page 476). The digits do not specifically refer to which address elements did not match, but rather why the address did not match. These fields are always included in the output from AssignGeoTAXInfo.

Match Code Definitions

columnName	Description
Ahhh	Same as Shhh, but indicates match to an alias name record or an alternate record.
Chh	Street address did not match, but located a street segment based on the input ZIP Code or city.
D00	Matched to a small town with P.O. Box or General Delivery only.
Ghhh	Matched to an auxiliary file.
Hhhh	House number was changed.
Qhhh	Matched to USPS range records with unique ZIP Codes. CASS rules prohibit altering an input ZIP if it matches a unique ZIP Code value.
Rhhh	Matched to a ranged address.
Shhh	Matched to USPS data. This is considered the best address match, because it matched directly against the USPS list of addresses. S is returned for a small number of addresses when the matched address has a blank ZIP + 4.
Thhh	Matched to a street segment record.
Uhhh	Matched to USPS data but cannot resolve the ZIP + 4 code without the firm name or other information.
Xhhh	Matched to an intersection of two streets, for example, "Clay St & Michigan Ave." The first hex digit refers to the last line information, the second hex digit refers to the first street in the intersection, and the third hex digit refers to the second street in the intersection.

Note: The USPS does not allow intersections as a valid deliverable address

columnName	Description
Yhhh	Same as Xhhh, but an alias name record was used for one or both streets.
Z	No address given, but verified the provided ZIP Code.

Definitions for 1st-3rd hex digit match code values

The table below contains the description of the hex digits for the match code values.

Note: The third hex digit is only populated for intersection matches or as part of the Extended Match Code.

- For intersection matches, use the table below for the 3rd hex digit definitions.
- For Extended Match Code, see [Definitions for Extended Match Code \(3rd hex digit values\)](#) on page 472.

Code	In first hex position means:	In second and third hex position means:
0	No change in last line.	No change in address line.
1	ZIP Code changed.	Street type changed.
2	City changed.	Predirectional changed.
3	City and ZIP Code changed.	Street type and predirectional changed.
4	State changed.	Postdirectional changed.
5	State and ZIP Code changed.	Street type and postdirectional changed.
6	State and City changed.	Predirectional and postdirectional changed.
7	State, City, and ZIP Code changed.	Street type, predirectional, and postdirectional changed.

Code	In first hex position means:	In second and third hex position means:
8	ZIP + 4 changed.	Street name changed.
9	ZIP and ZIP + 4 changed.	Street name and street type changed.
A	City and ZIP + 4 changed.	Street name and predirectional changed.
B	City, ZIP, and ZIP + 4 changed.	Street name, street type, and predirectional changed.
C	State and ZIP + 4 changed.	Street name and postdirectional changed.
D	State, ZIP, and ZIP + 4 changed.	Street name, street type, and postdirectional changed.
E	State, City, and ZIP + 4 changed.	Street name, predirectional, and postdirectional changed.
F	State, City, ZIP, and ZIP + 4 changed.	Street name, street type, predirectional, and postdirectional changed.

Definitions for Extended Match Code (3rd hex digit values)

Extended additional information is returned about any changes in the house number, unit number and unit type fields in the matched address, as well as whether there was address information that was ignored. This additional information is provided in a 3rd hex digit that is appended to match codes for address-level matches only - A, G, H, Q, R, S, T or U (see [Match Codes](#) on page 469).

Note: A typical match code contains up to 4 characters: a beginning alpha character followed by 2 or 3 hex digits. The third hex digit is only populated for intersection matches or as part of the Extended Match Code.

For information about the 3rd hex digit values for:

- Intersection matches, see [Definitions for 1st-3rd hex digit match code values](#) on page 471
- Extended Match Codes, see the table below.

"Address information ignored" is specified when any of these conditions apply:

- The output address has extra information (for example, a mailstop) in the address line.
- The output address has a second address line (`AddressLine2`).
- The input address is a dual address (two complete addresses in the input address). For example, "4750 Walnut St. P.O Box 50".
- The input last line has extra information that is not a city, state or ZIP Code, and is ignored. For example, "Boulder, CO 80301 USA", where "USA" is ignored when matching.

The table below provides descriptions of the Extended Match Code 3rd hex digit return values.

Input Addressline	Output Addressline	Extended Code	Description
4750 WALNUT ST STE 200	4750 WALNUT ST STE 200	0	Matched on all address information on line, including Unit Number and Unit Type if included.
4750 WALNUT ST C/O JOE SMITH	4750 WALNUT ST	1	Matched on Unit Number and Unit Type if included. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
4750 WALNUT ST UNIT 200	4750 WALNUT ST STE 200	2	Matched on Unit Number. Unit Type changed.
4750 WALNUT ST UNIT 200 C/O JOE SMITH	4750 WALNUT ST STE 200	3	Matched on Unit Number. Unit Type changed. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
4750 WALNUT ST STE 2-00	4750 WALNUT ST STE 200	4	Unit Number changed or ignored.
4750 WALNUT ST STE 2-00 C/O JOE SMITH	4750 WALNUT ST STE 200	5	Unit Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
4750 WALNUT ST STE 400	4750 WALNUT ST STE 400	6	Unit Number changed or ignored. Unit Type changed or ignored. In this example, Suite 400 is not valid for the input address, but the address match is not prevented because of an invalid unit number.

Input Addressline	Output Addressline	Extended Code	Description
4750 WALNUT ST UNIT 2-00 C/O JOE SMITH	4750 WALNUT ST STE 200	7	Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2.
47-50 WALNUT ST STE 200	4750 WALNUT ST STE 200	8	Matched on Unit Number and Unit Type if included. House number changed or ignored.
47-50 WALNUT ST STE 200 C/O JOE SMITH	4750 WALNUT ST STE 200	9	Matched on Unit Number and Unit Type if included. House number changed or ignored. Extra information not considered for matching moved to AddressLine2.
47-50 WALNUT ST UNIT 200	4750 WALNUT ST STE 200	A	Matched on Unit Number. Unit Type changed. House Number changed or ignored.
47-50 WALNUT ST UNIT 200 C/O JOE SMITH	4750 WALNUT ST STE 200	B	Matched on Unit Number. Unit Type changed. House Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2.
47-50 WALNUT ST STE 20-0	4750 WALNUT ST STE 200	C	House Number changed or ignored. Unit Number changed or ignored.
47-50 WALNUT ST STE 20-0 C/O JOE SMITH	4750 WALNUT ST STE 200	D	House Number changed or ignored. Unit Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2.
47-50 WALNUT ST UNIT 20-0	4750 WALNUT ST STE 200	E	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored.
47-50 WALNUT ST UNIT 2-00 C/O JOE SMITH	4750 WALNUT ST STE 200	F	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to AddressLine2.

The table below provides the descriptions for the Extended Match Code 3rd hex digit return values:

Note: For Landmark Auxiliary file matches, the 3rd hex digit is always "0".

Code	In 3rd hex position means:
0	Matched on all address information on line, including Unit Number and Unit Type if included.
1	Matched on Unit Number and Unit Type if included. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
2	Matched on Unit Number. Unit Type changed.
3	Matched on Unit Number. Unit Type changed. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
4	Unit Number changed or ignored.
5	Unit Number changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
6	Unit Number changed or ignored. Unit Type changed or ignored.
7	Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
8	Matched on Unit Number and Unit Type if included. House Number changed or ignored.
9	Matched on Unit Number and Unit Type if included. House Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
A	Matched on Unit Number. Unit Type changed. House Number changed or ignored.
B	Matched on Unit Number. Unit Type changed. House Number changed or ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
C	House Number changed or ignored. Unit Number changed or ignored.

Code	In 3rd hex position means:
D	House Number changed or ignored. Unit Number changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .
E	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored.
F	House Number changed or ignored. Unit Number changed or ignored. Unit Type changed or ignored. Extra information on address line ignored. Extra information on address line ignored. Extra information not considered for matching moved to <code>AddressLine2</code> .

Match Codes for No Match - Definitions for "Ennn" return codes

The table below describes the values returned when the application cannot find a match or an error occurs.

Code	"nnn" values	Description
Ennn		Indicates an error, or no match. This can occur when the address entered does not exist in the database, or the address is badly formed and cannot be parsed correctly. The last three digits of an error code indicate which parts of an address the application could not match to the database.
	nnn = 000	No match made.
	nnn = 001	Low level error.
	nnn = 002	Could not find data file.
	nnn = 003	Incorrect GSD file signature or version ID.
	nnn = 010	No city and state or ZIP Code found.
	nnn = 011	Input ZIP not in the directory.

Code	"nnn" values	Description
	nnn = 012	Input city not in the directory.
	nnn = 013	Input city not unique in the directory.
	nnn = 014	Out of licensed area. Only occurs if using Group 1 licensing technology.
	nnn = 015	Record count is depleted and license has expired.
	nnn = 020	No matching streets found in directory.
	nnn = 021	No matching cross streets for an intersection match.
	nnn = 022	No matching segments.
	nnn = 023	Unresolved match.
	nnn = 024	No matching segments. (Same as 022.)
	nnn = 025	Too many possible cross streets for intersection matching.
	nnn = 026	No address found when attempting a multiline match.
	nnn = 027	Invalid directional attempted.
	nnn = 028	Record also matched EWS data, therefore the application denied the match.
	nnn = 029	No matching range, single street segment found.

Code	"nnn" values	Description
	nnn = 030	No matching range, multiple street segments found.

Location Codes

The Location Codes indicate the methodology used to compute the geocode and may also provide some information about the quality of the geocode.

A Location Code of ""E" indicates a location code is not available. This usually occurs when you have requested ZIP Code centroids of a high quality, and one is not available for that match. It can occur infrequently when the Enterprise Tax Module does not have a 5-digit centroid location. An "E" location code type may also be returned when the input address cannot be standardized and there is no input ZIP Code. In this case, do not assume the ZIP Code returned with the nonstandardized address is the correct ZIP Code because the Enterprise Tax Module did not standardize the address; therefore, the Enterprise Tax Module does not return geocoding or Census Block information.

Location Codes

Location codes indicate the locational accuracy of the assigned geocode. Note that an accurately placed candidate is not necessarily an ideal candidate. Examine the match codes and/or result codes in addition to location codes to best evaluate the overall quality of the candidate.

Address Location Codes

Location codes that begin with an "A" are address location codes. Address location codes indicate a geocode made directly to a street network segment (or two segments, in the case of an intersection).

An address location code has the following characters.

1 st character	Always an "A" indicating an address location.
2 nd character	May be one of the following:
	C Interpolated address point location
	G Auxiliary file data location
	I Application infers the correct segment from the candidate records
	P Point-level data location

	R	Location represents a ranged address
	S	Location on a street range
	X	Location on an intersection of two streets
3 rd and 4 th character		Digit indicating other qualities about the location.

Location Codes

Code	Description
AGn	Indicates a geocode match to a GeoTAX Auxiliary or Landmark Auxiliary file where n is one of the following values:
n = 0	The geocode represents the center of a parcel, building or landmark.
n = 1	The geocode is an interpolated address along a segment.
n = 2	The geocode is an interpolated address along a segment, and the side of the street cannot be determined from the data provided in the auxiliary file record.
n = 3	The geocode is the midpoint of the street segment.
APnn	Indicates a point-level geocode match representing the center of a parcel or building, where nn is one of the following values:

Code	Description
nn = 02	<p>Parcel centroid</p> <p>Indicates the center of an accessor's parcel (tract or lot) polygon. When the center of an irregularly shaped parcel falls outside of its polygon, the centroid is manually repositioned to fall inside the polygon as closely as possible to the actual center.</p>
nn = 04	<p>Address points</p> <p>Represents field-collected GPS points with field-collected address data.</p>
nn = 05	<p>Structure point</p> <p>Indicates a location within a building footprint polygon that is associated with the matched address.</p> <p>Usually, residential addresses consist of a single building. For houses with outbuildings (detached garages, sheds, barns, etc.), the structure point will typically fall on the primary structure.</p> <p>Condominiums and duplexes have multiple, individual addresses and may have multiple structure points for each building. Multi-unit buildings are typically represented by a single structure point associated with the primary/base address, rather than discrete structure points for each unit.</p> <p>Shopping malls, industrial complexes, and academic or medical center campuses are commonly represented by a single structure point associated with the primary/base address for the entire complex. When multiple addresses are assigned to multiple buildings within one complex, multiple structure points may be represented within the same complex.</p>
nn = 07	<p>Manually placed</p> <p>Address points are manually placed to coincide with the midpoint of a parcel's street frontage at a distance from the center line.</p>

Code	Description
nn = 08	<p>Front door point</p> <p>Represents the designated primary entrance to a building. If a building has multiple entrances and there is no designated primary entrance or the primary entrance cannot readily be determined, the primary entrance is chosen based on proximity to the main access street and availability of parking.</p>
nn = 09	<p>Driveway offset point</p> <p>Represents a point located on the primary access road (most commonly a driveway) at a perpendicular distance of between 33-98 feet (10-30 meters) from the main roadway.</p>
nn = 10	<p>Street access point</p> <p>Represents the primary point of access from the street network. This address point type is located where the driveway or other access road intersects the main roadway.</p>
nn = 21	<p>Base parcel point</p> <p>The Centrus point data includes individual parcels that may be "stacked". These stacked parcels are individually identified by their unit or suite number, and Enterprise Tax Module is able to match to this unit number and return the correct tax jurisdictions. If an input address is for a building or complex without a unit number, the "base" parcel information returns and will not standardize to a unit number or return additional information such as tax jurisdictions.</p>
nn = 22	<p>Backfill address point</p> <p>The precise parcel centroid is unknown. The address location assigned is based on two known parcel centroids.</p>
nn = 23	<p>Virtual address point</p> <p>The precise parcel centroid is unknown. The address location assigned is relative to a known parcel centroid and a street segment end point.</p>

Code	Description
nn = 24	Interpolated address point The precise parcel centroid is unknown. The address location assigned is based on street segment end points.
AIn	The correct segment is inferred from the candidate records at match time.
ASn	House range address geocode. This is the most accurate street interpolated geocode available.
AIn, ASn and ACn share the same values for the 3 rd character "n" as follows:	
n = 0	Best location.
n = 1	Street side is unknown. The Census FIPS Block ID is assigned from the left side; however, there is no assigned offset and the point is placed directly on the street.
n = 2	Indicates one or both of the following: <ul style="list-style-type: none"> The address is interpolated onto a TIGER segment that did not initially contain address ranges. The original segment name changed to match the USPS spelling. This specifically refers to street type, predirectional, and postdirectional. <p>Note: Only the second case is valid for non-TIGER data because segment range interpolation is only completed for TIGER data.</p>
n = 3	Both 1 and 2.
n = 7	Placeholder. Used when starting and ending points of segments contain the same value and shape data is not available.

Code	Description
ARn	Ranged address geocode, where "n" is one of the following:
n = 1	The geocode is placed along a single street segment, midway between the interpolated location of the first and second input house numbers in the range.
n = 2	The geocode is placed along a single street segment, midway between the interpolated location of the first and second input house numbers in the range, and the side of the street is unknown. The Census FIPS Block ID is assigned from the left side; however, there is no assigned offset and the point is placed directly on the street.
n = 4	The input range spans multiple USPS segments. The geocode is placed on the endpoint of the segment which corresponds to the first input house number, closest to the end nearest the second input house number.
n = 7	Placeholder. Used when the starting and ending points of the matched segment contain the same value and shape data is not available.
AXn	Intersection geocode, where n is one of the following:
n = 3	Standard single-point intersection computed from the center lines of street segments.
n = 8	Interpolated (divided-road) intersection geocode. Attempts to return a centroid for the intersection.

Street centroid location codes

Street centroid location codes indicate the Census ID accuracy and the position of the geocode on the returned street segment. A street centroid location code has the following characters.

1 st character	Always "C" indicating a location derived from a street segment.
---------------------------	---

2 nd character	Census ID accuracy based on the search area used to obtain matching Street Segment.
---------------------------	---

3 rd character	Location of geocode on the returned street segment.
---------------------------	---

The table below contains the values and descriptions for the 2nd - 3rd characters in the street centroid location codes.

Character position	Code	Description
2 nd Character	B	Block Group accuracy (most accurate). Based on input ZIP Code.
	T	Census Tract accuracy. Based on input ZIP Code.
	C	Unclassified Census accuracy. Normally accurate to at least the County level. Based on input ZIP Code.
	F	Unknown Census accuracy. Based on Finance area.
	P	Unknown Census accuracy. Based on input City.
3 rd Character	C	Segment Centroid.

Character position	Code	Description
	L	Segment low-range end point.
	H	Segment high-range end point.

ZIP + 4 Location Codes

Location codes that begin with a "Z" are ZIP + 4 centroid location codes. ZIP + 4 centroid location codes indicate the quality of two location attributes: Census ID accuracy and positional accuracy. A ZIP + 4 centroid location code has the following characters.

1 st character		Always "z" indicating a location derived from a ZIP centroid.
2 nd character		Census ID accuracy.
3 rd character		Location type.
4 th character		How the location and Census ID was defined. Provided for completeness, but may not be useful for most applications.

The table below contains the values and descriptions for the 2nd - 4th characters in the ZIP + 4 location codes.

Character Position	Code	Description
2 nd Character		
	B	Block Group accuracy (most accurate).
	T	Census Tract accuracy.

Character Position	Code	Description
	C	Unclassified Census accuracy. Normally accurate to at least the County level.
<hr/>		
3 rd Character		
	5	Location of the Post Office that delivers mail to the address, a 5-digit ZIP Code centroid, or a location based upon locale (city). See the 4 th character for a precise indication of locational accuracy.
	7	Location based upon a ZIP + 2 centroid. These locations can represent a multiple block area in urban locations, or a slightly larger area in rural settings.
	9	Location based upon a ZIP + 4 centroid. These are the most accurate centroids and normally place the location on the correct block face. For a small number of records, the location may be the middle of the entire street on which the ZIP + 4 falls. See the 4 th character for a precise indication of locational accuracy.
<hr/>		
4 th Character		
	A	Address matched to a single segment. Location assigned in the middle of the matched street segment, offset to the proper side of the street.

Character Position	Code	Description
	a	Address matched to a single segment, but the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.
	B	Address matched to multiple segments, all segments have the same Block Group. Location assigned to the middle of the matched street segment with the most house number ranges within this ZIP + 4. Location offset to the proper side of the street.
	b	Same as methodology B except the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.
	C	Address matched to multiple segments, with all segments having the same Census Tract. Returns the Block Group representing the most households in this ZIP + 4. Location assigned to the middle of the matched street segment with the most house number ranges within this ZIP + 4. Location offset to the proper side of the street.
	c	Same as methodology C except the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.

Character Position	Code	Description
	D	Address matched to multiple segments, with all segments having the same County. Returns the Block Group representing the most households in this ZIP + 4. Location assigned to the middle of the matched street segment with the most house number ranges within this ZIP + 4. Location offset to the proper side of the street.
	d	Same as methodology D except the correct side of the street is unknown. Location assigned in the middle of the matched street segment, offset to the left side of the street, as address ranges increase.
	E	Street name matched; no house ranges available. All matched segments have the same Block Group. Location placed on the segment closest to the center of the matched segments. In most cases, this is on the mid-point of the entire street.
	F	Street name matched; no house ranges available. All matched segments have the same Census Tract. Location placed on the segment closest to the center of the matched segments. In most cases, this is on the mid-point of the entire street.
	G	Street name matched (no house ranges available). All matched segments have the same County. Location placed on the segment closest to the center of the matched segments. In most cases, this is on the mid-point of the entire street.
	H	Same as methodology G, but some segments are not in the same County. Used for less than .05% of the centroids.

Character Position	Code	Description
	I	Created ZIP + 2 cluster centroid as defined by methodologies A, a, B, and b. All centroids in this ZIP + 2 cluster have the same Block Group. Location assigned to the ZIP + 2 centroid.
	J	Created ZIP + 2 cluster centroid as defined by methodologies A, a, B, b, C, and c. All centroids in this ZIP + 2 cluster have the same Census Tract. Location assigned to the ZIP + 2 centroid.
	K	Created ZIP + 2 cluster centroid as defined by methodologies A, a, B, b, C, c, D, and d. Location assigned to the ZIP + 2 centroid.
	L	Created ZIP + 2 cluster centroid as defined by methodology E. All centroids in this ZIP + 2 cluster have the same Block Group. Location assigned to the ZIP + 2 centroid.
	M	Created ZIP+2 cluster centroid as defined by methodology E and F. All centroids in this ZIP + 2 cluster have the same Census Tract. Location assigned to the ZIP + 2 centroid.
	N	Created ZIP + 2 cluster centroid as defined by methodology E, F, G, and H. Location assigned to the ZIP + 2 centroid.
	O	ZIP Code is obsolete and not currently used by the USPS. Historic location assigned.

Character Position	Code	Description
	V	Over 95% of addresses in this ZIP Code are in a single Census Tract. Location assigned to the ZIP Code centroid.
	W	Over 80% of addresses in this ZIP Code are in a single Census Tract. Reasonable Census Tract accuracy. Location assigned to the ZIP Code centroid.
	X	Less than 80% of addresses in this ZIP Code are in a single Census Tract. Census ID is uncertain. Location assigned to the ZIP Code centroid.
	Y	Rural or sparsely populated area. Census code is uncertain. Location based upon the USGS places file.
	Z	P.O. Box or General Delivery addresses. Census code is uncertain. Location based upon the Post Office location that delivers the mail to that address.

Geographic Centroid Location Codes

Location codes that begin with "G" are geographic centroid location codes. Geographic centroids may be returned if the geographic centroid fallback option is enabled and an address-level geocode could not be determined. Geographic centroid location codes indicate the quality of a city, county, or state centroid.

1st character

Always "G" indicating a location derived from a geographic centroid.

2nd character

Geographic area type. One of the following:

M	Municipality (for example, a city)
C	County
S	State

Payroll Tax Correspondence File

Using a Payroll Tax Correspondence File

Payroll system tax codes are proprietary codes used by some payroll tax applications to represent specific jurisdictions or combinations of jurisdictions. If you have licensed this option, you can use a payroll tax correspondence (PTC) file to determine the payroll system tax codes for a given address.

To use a payroll system tax code database, customize the PTC file and then install the file.

1. Customize the PTC file.

After you receive your initial PTC file, modify it using a text editor of your choice. Specifically, you need to modify the following:

- **Description**—A meaningful description of the code that represents business rules within your organization.
- **Flags**—Flags indicate the payroll codes you want Assign GeoTAX Info to return. Possible flag values are:
 - **N**—No, do not return this payroll tax code. Continue searching the PTC file for other matching records. A blank flag has the same effect as "N".
 - **D**—Done. Return this payroll system tax code and stop searching the PTC file for other matching records.
 - **Any other value**—Any other value indicates to return the code. Typically, the letter Y (for "yes") is used. Use other flags if you like. For example, if there is an area with two codes, one for a work location and the other for the worker's residence, you could use flags of "W" and "R" so that the output field PTCn.PayrollFlag returned by AssignGeoTAX Info indicates the type of location.

The following table shows how to use flags.

Note: Each record in the PTC file can contain up to six payroll system tax codes and their associated descriptions and flags. In the following example, the first three codes are on the first record and the second three are on the second.

Record	Description	Payroll System Tax Code	Flag
1	HARBORCREEK TWP	123ABC	D
	HARBOR CREEK SD	456DEF	D
	HARBORCREEK TWP (M + SD)	789GHI	N
2	DAYTON BORO	592UID	Y
	ARMSTRONG SD	143XMA	Y
	DAYTON BORO (M + SD)	592JKT	N

In this example, the first record in the PTC file contains tax codes for a municipality called Harbor Creek Township and a school district called Harbor Creek School District. There is a separate code that represents points that are in both the Harbor Creek Township and the Harbor Creek School District. The second record in the PTC file contains codes for Dayton, a school district called Armstrong, and points located in both Dayton and the Armstrong School District.

This example returns the payroll system tax codes for the individual taxing jurisdictions for a given address, not the codes that represent the combined jurisdictions.

For addresses located in both the Harbor Creek Township and Harbor Creek School District, AssignGeoTAXInfo returns the following:

- PTC1.PayrollDescription=HARBORCREEK TWP
- PTC1.PayrollCode=123ABC
- PTC1.PayrollFlag=D
- PTC2.PayrollDescription=HARBOR CREEK SD
- PTC2.PayrollCode=456DEF
- PTC2.PayrollFlag=D

For addresses located in both Dayton and the Armstrong School District, AssignGeoTAXInfo returns the following:

- PTC1.PayrollDescription=DAYTON BORO
- PTC1.PayrollCode=592UID
- PTC1.PayrollFlag=Y
- PTC2.PayrollDescription=ARMSTRONG SD

- PTC2.PayrollCode=143XMA
- PTC2.PayrollFlag=Y
- For addresses located in just Dayton but not the Armstrong School District, AssignGeoTAXInfo returns the code 592UID and its associated flag and description. For addresses located in just the Armstrong School District but not Dayton, AssignGeoTAXInfo returns the code 143XMA and its associated flag and description.

Note: For a listing of output fields returned for payroll system tax codes, see [Payroll System Tax Code](#) on page 412.

The following table describes the PTC file layout.

Position	Length	Name
1	9	(required) Key Value. Lookup key into the file. Must be one of the following. <ul style="list-style-type: none"> • 5 character jurisdiction ID from the Pay.txb boundary file. This file contains polygons for special areas, such as school districts. • 9 character GNIS code. • 5 character county key made up of the State and County FIPS codes. • 2 character State FIPS code.
10	2	(optional) State
12	30	(optional) County
<p>The payroll code and payroll description fields are paired. Each pair has a corresponding flag field. The flag field determines if GeoTAX returns data for the corresponding payroll code and description fields. GeoTAX does not return the fields if the flag is N or blank. This lets you create meaningful flags based on your business rules.</p>		
42	15	Payroll code 1
57	40	Payroll description 1
97	15	Payroll code 2
112	40	Payroll description 2

Position	Length	Name
152	15	Payroll code 3
167	40	Payroll description 3
207	15	Payroll code 4
222	40	Payroll description 4
262	15	Payroll code 5
277	40	Payroll description 5
317	15	Payroll code 6
332	40	Payroll description 6
372	1	Flag 1
373	1	Flag 2
374	1	Flag 3
375	1	Flag 4
376	1	Flag 5
377	1	Flag 6

2. Install the PTC file. For instructions on installing the PTC file, see the *Spectrum™ Technology Platform Installation Guide*

PTC file updates are provided at intervals defined in your contract. When you receive the PTC update files, enter flags for the modified records and then run Enterprise Tax Module database load utility to merge the updated PTC file with your existing file. For instructions, see "Installing Payroll Tax Correspondence Files" in the *Spectrum™ Technology Platform Installation Guide*. This process maintains the existing user-defined flags you have already associated with the PTC data.

User-Defined Data Files

Creating a Landmark Auxiliary File

The Landmark Auxiliary File provides you a way to specify customized address information in your input records. The recommended primary use of this file is to match to your company's non-address locations such as well heads, transmission towers or any other descriptive location. The latitude/longitude that is part of the input needed to build this file allows companies to automatically keep track of any jurisdictional changes that affect these unique locations. Matching to this file requires that the input record information match exactly to the Landmark file contents. This also applies to street records if you choose to enter them in the Landmark file.

Note: A file template for Windows and Unix/Linux systems is available to more easily create a Landmark Auxiliary file. The template file is available in the data installation folder delivered with Enterprise Tax Module:

- **On Windows:** *InstallationDirectory\server\modules\gtx\data\LANDMARK.GAX*
- **On Unix/Linux:** *InstallationDirectory/server/modules/gtx/data/landmark.gax*

Where *InstallationDirectory* refers to the folder where you installed the Spectrum™ Technology Platform server.

Landmark Auxiliary file requirements

The Landmark Auxiliary file requirements include:

- The file must be a fixed-width text file: On Windows and UNIX, the text file must be ASCII
- The file must have a .gax extension on Windows and UNIX
- The file must have less than 500,000 records
- The file must follow the column field order and lengths specified in [Landmark File Layout](#).

Record types

You can include two types of records in your Landmark Auxiliary file: Landmark and Street Records.

A **Landmark record** represent a single site. To be a valid landmark record, the record must have the following fields:

- ZIP Code
- Name of the landmark - placed in the street name field
- Beginning latitude of the landmark
- Beginning longitude of the landmark

In addition, a Landmark record may NOT have the following fields:

- Street type abbreviation
- Pre-directional abbreviation
- Post-directional abbreviation
- Low house number
- High house number

A **Street record** contains a range of one or more addresses on a street. To be a valid street record the record must have the following fields:

- ZIP Code
- Street name
- Street type abbreviation, if part of the address
- Pre-directional abbreviation, if part of the address
- Post-directional abbreviation, if part of the address
- Low house number within the street segment
- High house number within the street segment
- Beginning longitude of the street segment
- Beginning latitude of the street segment

In addition, a Street record may NOT have the following fields:

- Secondary address information, such as unit numbers
- Mailstops
- Private mail boxes (PMBs)

During processing ignores any record that does not comply with the preceding requirements.

Landmark Auxiliary file organization

You must comply with the following organizational rules when creating your Landmark Auxiliary file.

- Use semicolons in the first column to indicate a row is a comment, not a data record; Enterprise Tax Module ignores rows that begin with a semicolon.
- Order the records within the file by descending ZIP Code then descending street name for optimal performance.
- All records must represent one or both sides of a street.
- All records must represent segments that are straight lines. Records cannot represent a non-straight segment.
- If house numbers are present in the record, the house number range must be valid according to USPS rules documented in Publication 28.
- The numeric fields, such as ZIP Codes, must contain all numbers.

- Latitude and longitude values must be in millionths of decimal degrees.
- Records cannot contain PO Box addresses.

Default values

Enterprise Tax Module uses the following defaults if you do not include the values in the Landmark Auxiliary file:

- House number parity = B (both odds and evens)
- Segment direction = F (forward) or A (ascending), these are interchangeable.
- Side of street = U (unknown)

Landmark Auxiliary file layout

Field	Description	Required For Street Segment Match	Required For Landmark Match	Requires Exact Match	Length	Position
ZIP Code	5-digit ZIP Code	X	X	X	5	1-5
Street name	Name of the street or landmark	X	X	X	30	6-35
Street type abbreviation	Street type. Also called street suffix. See the USPS Publication 28 for a complete list of supported street types.			X	4	36-39
Predirectional	USPS street name predirectional abbreviation. Supported values are N, E, S, W, NE, NW, SE, and SW.			X	2	40-41
Postdirectional	USPS street name postdirectional abbreviations. Supported values are N, E, S, W, NE, NW, SE, and SW.					
Reserved	Reserved				4	44-47
Low house number	Low house number of the address range.	X			11	48-58
High house number	High house number of the address range.	X			11	59-69

Field	Description	Required For Street Segment Match	Required For Lathrak Match	Requires Exact Match	Length	Position
House number parity ²	Parity of the house number in the range: <ul style="list-style-type: none"> • E - Even • O - Odd • B - Both 				1	70
Segment direction	Direction the house numbers progress along the segment from the viewpoint of the segment's starting coordinate: <ul style="list-style-type: none"> • F - Forward (default) or A - Ascending • R - Reverse or D - Descending 				1	71
Reserved	Reserved				1	72
FIPS state	US government FIPS state code.				2	73-74
FIPS county	US government FIPS county code.				3	75-77
Census tract	US Census tract number.				6	78-83
Census block group	US Census block group number.				1	84
Census block ID	US Census block ID number.				3	85-87
Reserved	Reserved				5	88-92
State abbreviation	USPS state abbreviation				2	93-95
County name	Name of the county.				25	95-119

² For even and odd house number parity records, this specifies on which side of the street the house lays. For records containing both even and odd house numbers, the odd house numbers are on the specified side of the street, and the even house numbers are on the other side. This is a factor when using street offset.

Field	Description	Required For Street Segment Match	Required For Lardrak Match	Requires Exact Match	Length	Position
MCD code	Minor Civil Division code.				5	120-124
MCD name	Minor Civil Division name.				40	125-164
CBSA code	Core Based Statistical Area code.				5	165-169
CBSA name	Core Based Statistical Area name.				49	170-218
Reserved	Reserved				5	219-223
City Name	City name. Overrides the city/state preferred city name upon a return.				40	224-263
Reserved	Reserved				237	264-500
User-defined data	User-defined data.				300	501-800
Record ID Number	User-defined unique record identifier.				10	801-810
Side of street	Side of the street for the address: <ul style="list-style-type: none"> • L - Left side • R - Right side • B - Both sides • U - Unknown side (default) This is from the viewpoint of the segment's starting coordinate.				1	811
Beginning longitude	Beginning longitude of the street segment in millionths of degrees.	X	X		11	812-822
Beginning latitude	Beginning latitude of the street segment in millionths of degrees.	X	X		10	823-832

Field	Description	Required For Street Segment Match	Required For Landmark Match	Requires Exact Match	Length	Position
Ending longitude	Ending longitude of the street segment in millionths of degrees.				11	833-843
Ending latitude	Ending latitude of the street segment in millionths of degrees.				10	844-853

Matching to the Landmark Auxiliary file

Enterprise Tax Module performs the following steps when matching an input address to a Landmark Auxiliary file.

1. Enterprise Tax Module determines if there is a Landmark Auxiliary file present. If more than one Landmark Auxiliary file is present, Enterprise Tax Module attempts to match against the first file. Enterprise Tax Module ignores any additional Landmark Auxiliary files for matching, regardless if Enterprise Tax Module found a match to the first auxiliary file.

If a record within the Landmark Auxiliary files is invalid, Enterprise Tax Module returns a message indicating the auxiliary file has an invalid record. Enterprise Tax Module continues to process input addresses against the Landmark Auxiliary file, but will not match to the invalid auxiliary file record.

2. If the Landmark Auxiliary file is present, Enterprise Tax Module first attempts to match to it. If more than one type of auxiliary file is present, the search order is:

- Landmark Auxiliary file
- User Auxiliary file
- State-supplied file
- GeoTAX Auxiliary file

Note: Enterprise Tax Module only matches your input address to your Landmark Auxiliary file if there is an exact match. Therefore, your input address list should be as clean as possible; free of misspellings and incomplete addresses.

3. If Enterprise Tax Module finds an exact record match to the Landmark Auxiliary file, it standardizes the match to USPS regulations and returns the output of the auxiliary file match.

Note: You cannot update the Landmark Auxiliary file while Enterprise Tax Module is running. If you want to update the auxiliary file, you need to terminate Enterprise Tax Module before attempting to replace or edit the file.

Record type matching rules

When attempting a match against the Landmark Auxiliary file, GeoTAX abides by the following rules:

Landmark record match

- The input data must contain both a ZIP Code and address line, and they must exactly match the values on the auxiliary record.
- The input address cannot have any other data, such as a house number, unit number, or Private Mail Box (PMB).

Note: Enterprise Tax Module only matches the ZIP Code against the auxiliary file. GeoTAX does not verify that the ZIP Code of the input address record is correct for the city and state. You should validate this information in your input address before processing against the auxiliary file.

Street record match

- The input house number must fall within or be equal to the low and high house number values of the auxiliary record.
- The input house number must agree with the parity of the auxiliary record.
- The input ZIP Code must exactly match the ZIP Code of the auxiliary record.

Creating a User-Defined Auxiliary File

To enter data in a user-defined auxiliary file, you can use your own editor or data entry program. If you are running on Windows, you can use the Auxiliary File Editor available on the *GeoTAX Utilities CD*. The *GeoTAX Utilities CD* can be downloaded from the www.g1.com/Support web site. Select the **GeoTAX** product page; the utilities download and document links are provided on the **Subcomponents** panel.

Sort the records by ascending ZIP Code, street name, street type, directional, low house range, and descending high house range to minimize the time required to street-level match.

The auxiliary file has a block size of 8K, key length of 47 bytes, and record length of 800 bytes. The sample file `SEQAUX` illustrates the layout of the file.

The following table describes the layout of the auxiliary file. After you create a file with this layout, install the file using the Enterprise Tax Module database load utility. For instructions, see the Spectrum™ Technology Platform Installation Guide.

Position	Field Name	Description	Length
Input Key Area (Must be Unique)			
1-5	G1GTAUX-ZIP-CODE	ZIP Code	5

Position	Field Name	Description	Length
6-35	G1GTAUX-STREETNAME	Street name	30
36-39	G1GTAUX-STREET-TYPE	Street type	4
40-41	G1GTAUX-PRE-DIR	Predirectional	2
42-43	G1GTAUX-POST-DIR	Postdirectional	2
44-47	G1GTAUX-SEQ	Sequence number, from 0001-9999	4
Output Area			
48-58	G1GTAUX-OUTPUTRANGE-FROM	First number in the house number range (right adjusted, blankfilled)	11
59-69	G1GTAUX-OUTPUTRANGE-TO	Last number in the house number range (right adjusted, blankfilled)	11
70	G1GTAUX-OUTPUTODD-EVEN	<ul style="list-style-type: none"> • O = Odd • E = Even 	1
71	G1GTAUX-OUTPUTASC-DESC	<ul style="list-style-type: none"> • A = Ascending • D = Descending 	1
72	Reserved		
73-74	G1GTAUX-STATE-CODE	FIPS State Code	2,0

Position	Field Name	Description	Length
75-77	G1GTAUX-COUNTYCODE	FIPS County Code	3,0
78-83	G1GTAUX-CENSUSTRACT	6-digit Census Tract number	6,0
84	G1GTAUX-BLOCKGROUP	1-digit Block Group	1
85-92	Reserved		8
93-94	G1GTAUX-STATE-ABBV	USPS state abbreviation	2
95-119	G1GTAUX-COUNTYNAME	County name	25
120-124	G1GTAUX-MCD-CODE	5-digit MCD Code	5,0
125-164	G1GTAUX-MCD-NAME	MCD Name	40
165-168	G1GTAUX-MSA-CODE	4-digit MSA Code	4,0
169-218	G1GTAUX-MSA-NAME	MSA Name	50
219-223	G1GTAUX-PLACE-CODE	5-digit Place Code	5,0
224-263	G1GTAUX-PLACENAME	Place Name	40
264-265	G1GTAUX-PLACECLASS-CODE	2-digit Place Class Code	2
266	G1GTAUX-PLACE-INCFLAG	<ul style="list-style-type: none"> • U - Unincorporated • I - Incorporated 	1

Position	Field Name	Description	Length
267-273	G1GTAUX-PLACE-LASTANNEXED	Place last annexed date, in the format MM/YYYY	7
274-280	G1GTAUX-PLACE-LASTUPDATED	Place last updated date, in the format MM/YYYY	7
281-287	G1GTAUX-PLACE-LASTVERIFIED	Place last verified date, in the format MM/YYYY	7
288-296	G1GTAUX-PLACE-GNIS	GNIS Code	9
297-500	Reserved		204
501-800	G1GTAUX-AUX-AREA	User-defined data	300

Creating a User-Defined Boundary File

User-defined boundary files define areas of interest to your organization, such as sales territories or insurance rating territories. AssignGeoTAXInfo uses this data to determine if an address falls within an area of interest. For example, you can create a boundary file that defines your sales territories. AssignGeoTAXInfo can then determine the tax jurisdictions that apply to an address and the sales territory of that address.

Note: User-defined boundary files in AssignGeoTAXInfo allow you to perform basic "point-in-polygon" spatial analysis. Point In Polygon provides additional point-in-polygon features.

1. Create an ESRI shapefile (.SHP) or MapInfo data interchange format file (.MIF) with the boundaries you want. Your .SHP or .MIF file can have up to three columns of user-defined data. The first and second columns are 10 bytes long and the third column is 50 bytes long. For information on .SHP and .MIF files, see [User-Defined Centrus Databases](#).
2. Use the Boundary File Conversion utility to convert your .SHP or .MIF file to a .TXB file. The Boundary File Conversion utility is available on the *GeoTAX Utilities CD*. The *GeoTAX Utilities CD* can be downloaded from the www.g1.com/Support web site. Select the **GeoTAX** product page; the utilities download and document links are provided on the **Subcomponents** panel.
3. Load the User-Defined Boundary file using the appropriate database load procedure based on your platform. The filename that should be entered for the User-Defined Boundary file is *usr.txb*.

Type Codes

The returned type code is referenced from an installed tax district file and indicates the type of tax district or tax jurisdiction for the address location.

This appendix provides the definitions for the following tax district files' type codes:

- **Special Purpose Districts (SPD)**
- **Insurance Premium Districts (IPD)**
- **Payroll Tax Districts (PAY)**

Special Purpose Districts (SPD)

Type	Descriptions
AMB	AMBULANCE DISTRICT
ASC	SALES AND USE TAX
ATA	ADVANCED TRANSPORTATION AUTHORITY
ATD	AIRPORT TAX DISTRICT
BSD	BASEBALL STADIUM DISTRICT
CAD	COUNTY ASSISTANCE DISTRICT
CCD	CRIME CONTROL DISTRICT
CFA	COUNTY FINANCE AUTHORITY
CMB	COMBINED DISTRICT
CTY	CITY TRANSACTIONS
DVD	DEVELOPMENT DISTRICT
EDD	ECONOMIC DEVELOPMENT DISTRICT
EDZ	ECONOMIC DEVELOPMENT ZONE

Type	Descriptions
ESD	EMERGENCY SERVICES DISTRICT
FCD	FIRE CONTROL DISTRICT
FPA	FLOOD PROTECTION AUTHORITY
FPD	FIRE PROTECTION DISTRICT
FSD	FOOTBALL STADIUM DISTRICT
HBZ	HOSPITAL BENEFIT ZONE
HSA	HOUSING AUTHORITY
HSD	HEALTHCARE SERVICES DISTRICT
HSP	HOSPITAL DISTRICT
IMP	IMPROVEMENT DISTRICT
IRD	INDIAN RESERVATION
LFW	LFW/CDC
LIB	LIBRARY DISTRICT
MSD	MUSEUM DISTRICT
MTA	METRO TRANSPORTATION AUTHORITY
OSA	OPEN SPACE AUTHORITY
PFD	PUBLIC FACILITY DISTRICT
POL	POLICE DISTRICT
PRD	PARK AND RECREATION DISTRICT
PSI	PUBLIC SAFETY IMPROVEMENT

Type	Descriptions
RCT	RACE TRACK
RDA	REVENUE DEVELOPMENT AREA
RMA	ROAD MAINTENANCE AUTHORITY
RTA	REGIONAL TRANSPORTATION AUTHORITY
RTD	RESTAURANT TAX DISTRICT
SAD	SPORTS DISTRICT
SCD	SCIENCE AND CULTURAL DISTRICT
SUT	SALES AND USE TAX
TDD	TRANSPORTATION DEVELOPMENT DISTRICT
TED	TOURISM COMMUNITY ENHANCEMENT DISTRICT
UNI	SCHOOL DISTRICT
URA	URBAN RENEWAL AUTHORITY
WCD	WATER COMMISSION DISTRICT
ZOO	ZOO DISTRICT

Insurance Premium Districts (IPD)

State	Type	Descriptions
AL	FIRE	Fire District
AL	NT-MUN	Non-Taxing Municipality
AL	PREM	Premium Tax District

State	Type	Descriptions
AZ	PRIV	Private Fire District
AZ	PUB	Public Fire District
DE	FIRE	Fire District
FL	FIRE	Fire District
FL	POLICE	Police District
GA	PREM	Premium Tax District
IL	FIRE	Fire District
KY	COUNTY	County
KY	MUNI	Municipality
KY	USD	Urban Services District
LA	PREM	Premium Tax District
MN	FIRE	Fire District
ND	FIRE	Fire District
NJ	FIRE	Fire District
NY	FIRE	Fire District
SC	FIRE	Fire District
SC	NT-MUN	Non-Taxing Municipality
SC	PREM	Premium Tax District
TX	PROP	Windstorm Surcharge on Property Line

Payroll Tax Districts (PAY)

Type	Descriptions
JED	Joint Economic Development District
MTA	Mass Transit Authority
MUN	Municipality
UNI	School District

Class Codes

This appendix lists definitions for the FIPS Class Codes.

Class C—Incorporated Places

Class Code	Description
C1	<p>Identifies an active incorporated place that is not also recognized as an Alaska Native Village Statistical area, and does not also serve as a primary county division; that is, it is included in and is part of a primary county division.</p> <p>For example, the city of Hammond, Indiana is within and part of North township; the city of Austin, Texas is within and part of several census county divisions in several counties; Hammond and Austin are coded C1.</p>
C2	<p>Identifies an incorporated place that also serves as a primary county division because, although the place is coextensive with a minor civil division (MCD), the Census Bureau, in agreement with State officials, does not recognize the MCD for presenting census data because the MCD is a nonfunctioning entity; applies to Iowa and Ohio only.</p> <p>For example, the city of Dubuque, Iowa is coextensive with Julien township, which does not function as a governmental unit and may not be well-known even to local residents; the city is assigned code C2, and the township, Z8. This subclass is new for FIPS 55-3. Also see subclass C5.</p>

Class Code	Description
------------	-------------

C3	<p>Identifies a consolidated city; that is, an incorporated place that has consolidated its governmental functions with a county or MCD, but continues to include other incorporated places that are legally part of the consolidated government.</p> <p>For example, the city of Columbus, Georgia is consolidated with Muscogee County, which continues to exist as a nonfunctioning legal entity in the State; however, the town of Bibb City continues to exist as a separate active incorporated place within the consolidated government and, therefore, Columbus is treated as a consolidated city. At the time of publication, there are seven consolidated cities in the United States: Athens-Clarke County, Georgia; Butte-Silver Bow, Montana; Columbus, Georgia; Indianapolis, Indiana; Jacksonville, Florida; Milford, Connecticut; and Nashville-Davidson, Tennessee. This subclass is new for FIPS 55-3.</p>
C4	<p>Identifies an alternate authoritative common name of any member of the other subclasses of Class C. The entity code of the legal name is referenced in the "Other Name Code" of the record, and in the entry for the legal name, the Other Name Code references the alternate.</p> <p>For example, the entity in California whose legal name is San Buenaventura (subclass C1) is commonly known as Ventura, which is coded C4.</p>
C5	<p>Identifies an incorporated place that also serves as a primary county division; that is, it is not included in any adjacent primary county division of class T or Z. For example, Boston, MA, is legally a primary division of the county and recognized as an incorporated place and, therefore, is coded C5. Also see subclass C2.</p>
C6	<p>Identifies an incorporated place that is coincident with or approximates an Alaska Native Village statistical area. The Other Name Code references the Alaska Native Village statistical area; see code E6.</p>
C7	<p>Identifies an independent city. At the time of publication, independent cities exist in only four States: Maryland (Baltimore City), Nevada (Carson City), Missouri (St. Louis City), and Virginia (41 cities). These cities also serve as county equivalents, and all but Carson City also serve as primary county divisions.</p>
C8	<p>Identifies the portion of a consolidated city that is not within another incorporated place; see subclass C3. The Census Bureau identifies these nonfunctioning entities by taking the name of the consolidated city and appending in parentheses the word remainder. For example, Columbus (remainder) identifies the portion of the Columbus, Georgia consolidated city that is not also in Bibb City. This code is new for FIPS 55-3.</p>
C9	<p>Identifies an inactive or nonfunctioning incorporated place.</p>

Class U—Unincorporated Places (Except Those Associated with Facilities)

Type	Descriptions
U1	Identifies a census designated place (CDP) with a name identical to the authoritative common name that describes essentially the same population. Also see code M2.
U2	Identifies a CDP with a name not identical to an authoritative common name of essentially the same area. If there is an alternate authoritative common name, it is referenced in the Other Name Code field. For example, Suitland-Silver Hill, Maryland is the name of a locally delineated CDP recognized by the Census Bureau which is a combination of two communities Suitland and Silver Hill and, therefore, because it is not the authoritative name of the area, is coded U2; Sierra Vista Southeast, Arizona is a CDP that includes the built-up area adjoining the city of Sierra Vista on the southeast, but is not an authoritative name for that area and, therefore, is coded U2. Also see code M2.
U3	Identifies (a) an alternate, authoritative common name of a population essentially described by a specific CDP with a different name (the Other Name Code references the CDP), or (b) a community wholly or substantially within the boundaries of a CDP with a different name (the Part of Code references the CDP). For example, Silver Hill and Suitland are coded U3 and cross-referenced to the CDP of Suitland-Silver Hill (see code U2).
U4	Identifies a populated place wholly or substantially within the boundaries of an incorporated place with a different name; the Part of Code identifies the incorporated place. For example, Harlem and Greenwich Village, which are part of New York city, and Hollywood, which is part of Los Angeles, California, are coded U4.
U5	Dropped. Only one place the CDP of Arlington, Virginia was in this subclass in FIPS PUB 95-2; it has been recoded as U1 as a place and as Z3 as a subclass in FIPS 55-3 as a county subdivision.
U6	Identifies a populated place located wholly or substantially outside the boundaries of any incorporated place or CDP with an authoritative common name recognized by the U.S. Geological Survey.
U8	Identifies a populated place located wholly or substantially outside the boundaries of an incorporated place or CDP but whose name has not been verified as authoritative by the U.S. Geological Survey.
U9	Identifies a CDP that is coincident with or approximates the area of an Alaska Native Village statistical area. The Other Name Code references the Alaska Native Village statistical area; see code E2. This code is new for FIPS 55-3.

GeoConfidence Module

GeoConfidence Module

The GeoConfidence Module is used to determine the probability that an address or street intersection is within a given area. The module takes an address or intersection's location (determined by Geocode US Address), converts that location to a point, line, or polygon (depending on the precision of the match), then compares that shape with a database of known shapes to see if the two overlap, and the percentage overlap. For example, you could use the GeoConfidence Module to make decisions on a flood zone rating based on how much overlap there is between an address's location and the flood zone data. Anything greater than a 95% overlap with a 100-year flood zone may indicate that the address is in the flood zone. Conversely, anything less than 95% could cause your business process to send the address to exception processing that might include a manual review.

An address or intersection can be geocoded to a point, an address along a street segment (an array of street segment points), ZIP + 4 centroid, ZIP + 2 centroid, or ZIP Code centroid (polygons). You can use these shapes (points, lines, or polygons) to compare with other shapes to determine overlap, which can be used to determine a risk or probability.

Different geoconfidence polygons are generated depending on the GeoConfidence result returned by the Enterprise Geocoding Module. For more information about the GeoConfidence information returned by the Enterprise Geocoding Module, see the Enterprise Geocoding Module documentation.

The GeoConfidence Module supports U.S. locations only.

Note: GeoConfidence uses services provided by the Enterprise Geocoding and Spatial modules.

Stages

GeoConfidence deploys three dataflows that you can modify in Enterprise Designer. Each dataflow consists of various stages that were installed with the Enterprise Geocoding and Spatial modules.

For information about each stage in the installed dataflows, see the relevant component chapter in the *Spectrum™ Technology Platform User's Guide*.

The names of the dataflows are:

- **GeoConfidenceSurface** This is the dataflow that creates the geoconfidence surface that can be used for further analysis. The input is the GeoConfidence information that is returned from the Enterprise Geocoding Module. Currently, only the Geocode US Address stage can return this information.

- **CreatePointsConvexHull** This is a subflow that is used by the GeoConfidenceSurface template. You should not need to make any changes to this subflow.
- **FloodRiskAnalysis** This is an example dataflow.

GeoConfidence Databases

GeoConfidence uses the same databases as the Enterprise Geocoding and Spatial modules. For information about how to add these databases, see the *Spectrum™ Technology Platform Administration Guide*.

In addition to these databases, the GeoConfidence Module includes a database of ZIP Code polygons. This is used by GeoConfidenceSurface.

GeoConfidenceSurface

GeoConfidenceSurface returns geoconfidence polygons (also called surfaces) based on the quality of the geocode information generated by the Enterprise Geocoding Module. With the geoconfidence polygons generated, you can then overlap this polygon with other spatial data to determine a risk or probability.

This service is used by the GeoConfidence Module's FloodZoneAnalysis dataflow template.

Note: GeoConfidence uses services provided by the Enterprise Geocoding and Spatial modules.

Input

The input fields for GeoConfidenceSurface are the output fields returned by the GeoConfidence output category of the Enterprise Geocoding Module. These fields are described below.

columnName	Max. Field Length with null terminator	Description
GeoConfidenceCode	13	<p>The value returned in this field indicates which geoconfidence surface type has been returned.</p> <p>The possible values are:</p> <p>INTERSECTION A geocode point for the intersection of two streets.</p> <p>ADDRESS An array of street segment points representing the street segment where the address is located.</p> <p>POINT If the geocoder was able to match the address using point data, the point geometry where the address is located.</p> <p>POSTAL1 A geocode point for the ZIP centroid.</p> <p>POSTAL2 An array of points for all street segments in the ZIP + 2 in which the address is located.</p> <p>POSTAL3 An array of points for street segments in the ZIP + 4 in which the address is located.</p> <p>ERROR An error has occurred.</p>
StreetSegmentPoints	1024	<p>An array of latitude/longitude values that represent the street segment points.</p> <p>Note: This field contains values only if the <code>GeoConfidenceCode</code> field returns a value of <code>ADDRESS</code>, <code>POSTAL2</code>, or <code>POSTAL3</code>.</p>
GeoConfidenceCentroidLatitude	11	The latitude of the centroid of the geoconfidence polygon.
GeoConfidenceCentroidLongitude	12	The longitude of the centroid of the geoconfidence polygon.

Output

The `GeoConfidenceSurface` output field contains the geoconfidence polygon.

columnName	Description
Geometry	A geoconfidence polygon that represents the returned geometry.

Customizing the GeoConfidence Module

The GeoConfidence Module deploys three dataflow templates that you can modify in Enterprise Designer. Each dataflow consists of various components that were installed with the Enterprise Geocoding and Spatial modules.

The names of the dataflow templates are:

- **GeoConfidenceSurface** This is the template that creates the geoconfidence surface that can be used for further analysis. The input is the GeoConfidence information that is returned from the Enterprise Geocoding Module. Currently, only the Geocode US Address stage can return this information. To customize this template, you must at minimum specify the 5-digit ZIP Code spatial source in the ZIP stage (Query Spatial).
- **CreatePointsConvexHull** This is a subflow that is used by the GeoConfidenceSurface template. You should not need to make any changes to this subflow.
- **FloodRiskAnalysis** This is an example template. To customize this template, you must at minimum specify Flood spatial source in the Find Nearest stage.

Global Addressing Module

Global Addressing Module

The Global Addressing Module for the Spectrum™ Technology Platform provides enhanced address standardization and validation. The Global Addressing Module benefits include:

- **Better data**—Global Address Validation combines data from multiple data sources into a single Global Addressing Validation database to provide the most extensive and accurate international addressing data possible. For the United States, we offer a USPS® CASS Certified™ solution.
- **Global addressing expertise**—Global Addressing Validation analyzes and compares each input address to the Global Addressing database for the appropriate country. If needed, Global Address Validation corrects and formats the address based on postal standards and user preferences.
- **Automated address suggestion**—Global Type Ahead automatically suggests addresses as you type characters.

- **Address parsing**—Global Address Parser splits address strings into individual address elements with the help of machine learning techniques.
- **Database searching**—US Database Lookup provides the ability to search the US Database directly for address information including house number, street name, city name, and ZIP Code.

Components

The Global Addressing Module consists of:

- **Global Address Parser**—Splits address strings into individual address elements, such as organization name, city, locality, district, and postal code, using machine learning techniques.
- **Global Address Validation**—Analyzes and compares each input address to the Global Addressing database for the appropriate country. If needed, Global Address Validation corrects and formats the address using the postal standards for that country.
- **Global Type-Ahead**—Automatically suggests addresses as you type and immediately returns candidates based on your input.
- **US Database Lookup**—Provides the ability to search the US Database directly for address information.

Global Address Validation

Global Address Validation provides enhanced address standardization and validation. Global Address Validation is part of the Global Addressing Module.

Supported Countries

Global Address Validation provides enhanced address standardization and validation for the following prioritized countries. The three-digit ISO country code is shown for each country. For a complete list of all ISO country codes, see [ISO Country Codes and Coder Support](#).

- Argentina (ARG)
- Australia (AUS)
- Austria (AUT)
- Belgium (BEL)
- Brazil (BRA)
- Canada (CAN)
- China (CHN)
- Czech Republic (CHZ)
- Denmark (DNK)
- Finland (FIN)
- France (FRA)
- Germany (DEU)
- Greece (GRC)
- India (IND)
- Ireland (IRL)

- Italy (ITA)
- Japan (JPN)
- Malaysia (MYS)
- Mexico (MEX)
- Netherlands (NLD)
- New Zealand (NZL)
- Norway (NOR)
- Poland (POL)
- Russia (RUS)
- Spain (ESP)
- Sweden (SWE)
- Switzerland (CHE)
- United Kingdom (GBR) (Includes POI information)
- United States (USA)

Global Address Validation provides additional support for 130+ countries worldwide.

Options

Global Address Validation uses the default options settings to define address validation processing.

Table 47: Global Addressing Options

Option Name	Country Support	Description
Default country	All	<p>The default country for address processing.</p> <p>To improve coding performance when your input addresses do not contain country information, set up an additional instance of the Global Address Validation stage as a preliminary stage to process and retrieve the country code for the input addresses.</p> <ol style="list-style-type: none"> 1. Set up an additional instance of the Global Address Validation stage as a preliminary (first) stage in your dataflow. <ul style="list-style-type: none"> Give the preliminary stage a unique label. For example, "Identify Country". Specify "World" as the default country for the preliminary stage. The preliminary stage uses the available input address elements with additional data sources (available when you select "World" as the default country) to determine the country code. The "country-coded" output from the preliminary stage becomes the input for the next step in the dataflow. 2. As the next step in the dataflow, the addresses are sent through a second Global Address Validation stage with the proper country code (retrieved in the preliminary stage) to validate the address to the street/house/premise level.

Global Addressing Options

Global Address Validation uses the Global Addressing options settings to define address validation processing.

Table 48: Global Addressing Options

Option Name	Country Support	Description
Global Addressing Options	All except USA	The options specific to global address processing.
City fallback	All except USA	When a street level match cannot be made, use the input city to determine match candidates.
Postal fallback	All except USA	When a street level match cannot be made, use the input postal code to determine match candidates.

Matching Options

Global Address Validation uses the Matching options settings to define address validation processing.

Table 49: Matching Options

Option Name	Country Support	Description
Match mode	All	<p>Match modes determine the leniency used to make a match between the input address and the reference data. Select one of the following match modes based on the quality of your input and your desired output.</p> <p>Exact A very tight match. This restrictive mode generates the fewest match candidates. When using this mode, ensure that your input is very clean; free of misspellings and incomplete addresses.</p> <p>Relaxed A loose match. This mode generates the most match candidates and results in more multiple matches. Use this mode if you are not confident that your input is clean and free of misspellings and incomplete addresses.</p> <p>Note: For USA, the relaxed match mode is only allowed for the US Database Lookup.</p> <p>Custom A custom match. Allows you to define the matching criteria by selecting Custom Match Fields.</p>

Option Name	Country Support	Description
Maximum records to return		<p>The number of match candidates to return. Using a looser Match Mode setting such as "Relaxed" can result in the matching output including multiple match candidates.</p> <ul style="list-style-type: none"> • If an exact match is found, the single match candidate is returned. • If an exact match is not found and the maximum records to return option is set to a value other than 1, Global Address Validation returns the specified number of match candidate suggestions when match candidate suggestions are available. <p>For example, an exact match is not found. The maximum records to return is set to 3. Processing finds 8 match candidate suggestions. However, since maximum records to return is set to 3, only the three best match candidate suggestions are presented to the user to select the desired match candidate.</p> <p>In another example, an exact match is not found. The maximum records to return is set to 5. However, processing only finds two match candidate suggestions. In this example, only the two available match candidate suggestions are presented to the user to select the desired match candidate.</p> <p>Note: If you specify ON for the CASS Flag, CASS processing overrides the Maximum Records to Return to 1 (for the current processing run). Multiple candidate suggestions are not valid when CASS processing is turned ON.</p>
Prefer PO Box over street	CAN FRA GBR	Prefer candidates matching the input PO Box over matches to the input street. The default is disabled.
Prefer postal code over city	AUS	Prefer candidates matching the input postal code over matches to the input city. The default is disabled.

Custom Match Options

Global Address Validation uses the custom match options to set custom match criteria for determining match candidates. To enable these options, you must set the **Match Mode** to `Custom`. By default, these options are disabled.

Table 50: Custom Match Options

Option Name	Country Support	Description
Address number	All except USA	A match must be made to the input address number.
City	All except USA	A match must be made to the input address city.
City subdivision	All except USA	A match must be made to the input address city subdivision.
State/province	All except USA	A match must be made to the input address state or province.
State/province subdivision	All except USA	A match must be made to the input address state or province subdivision.
Street	All except USA	A match must be made to the input street name, type, and directional fields.
Postal code	All except USA	A match must be made to the input address postal code.

US Addressing Options

Global Address Validation uses the US Addressing options settings to define U.S. address processing.

Table 51: US Addressing Options

Option Name	Description
CASS flag	Process in a United States Postal Service (USPS) CASS-certified mode. Note: If you are performing Global Address Validation US Addressing processing outside of the physical United States, you must disable the Delivery Point Validation (DPV), LACSLink, SuiteLink, and Residential Delivery Indicator (RDI) options. You will not be able to run in a USPS CASS-certified mode.
Assign abbreviated city	Return abbreviated city names in the label lines.

Option Name	Description
Remove noise characters	Remove input noise characters (for example, unnecessary punctuation and blanks).
Return input firm	Return the input firm.
All street matching	Perform All Street Matching (ASM) processing. ASM applies additional matching logic to correct errors in street names to find a match. For example, when the first letter of a street is misspelled or missing on input, ASM searches all street names in a locality to find an input address. ASM provides the best address validation but may reduce performance. ASM processing is available for U.S. addresses only.
R777 deliverable	<p>Addresses with Carrier Route code R777 are phantom routes and are not eligible for street delivery. However, since these addresses are assigned a ZIP + 4 code by the USPS, these addresses are marked as deliverable. If you do not want the addresses with Carrier Route code R777 marked as deliverable, disable this option and the following actions are performed for the address:</p> <ul style="list-style-type: none"> • ZIP + 4 code is not assigned. • The address is not counted on the USPS Form 3553 (CASS Summary Report) • DPV Footnote Code R7 is returned.
Convert secondary to PMB	<p>Convert secondary information to Private Mail Box (PMB) under the following conditions:</p> <ul style="list-style-type: none"> • A secondary number is present in the returned ZIP + 4 address. • The secondary number does not DPV confirm. • The primary number (and/or other secondary number) confirms as a Commercial Mail Receiving Agency (CMRA). • The unconfirmed unit designator is not a pound sign (#). <p>Note: This processing only applies if the primary address codes to a CMRA.</p>
Save unit in separate field	Do not merge separate second unit and PMB information in the output address line. Save unit in a separate field.
Save PMB in separate field	Do not merge separate second unit and PMB information in the output address line. Save PMB in a separate field.

Option Name	Description
Return alias street	<p data-bbox="597 321 1429 384">Return alias street names in the label line. An alias street name is an alternate name for a street, maintained at the ranged ZIP + 4 Code level.</p> <ul data-bbox="597 405 1429 1018" style="list-style-type: none"><li data-bbox="597 405 1429 520">• Return input alias or base. If the input address matches to an alias, return the alias. If the input address matches to a base address, but a preferred alias exists, return the preferred alias. If the input address matches to a base address and no Preferred alias exists, return the base address<li data-bbox="597 531 1429 583">• Return preferred alias or base. If a preferred alias exists, return the preferred alias. Otherwise, return the base street.<li data-bbox="597 594 1429 709">• Return preferred, abbreviated, input alias or base. Return the preferred alias. If no preferred alias exists, return the abbreviated alias. If no abbreviated or preferred alias exists, but some other alias type was input, return the input alias. If none of these scenarios apply, return the base street name.<li data-bbox="597 720 1429 804">• Return preferred, abbreviated alias, or base. If a preferred alias exists, return the preferred alias. If no preferred alias exists, return the Abbreviated alias. If neither exists, return the base street name.<li data-bbox="597 814 1429 919">• Return abbreviated, preferred, input alias or base. Return the abbreviated alias. If no abbreviated alias exists, return the preferred alias. If no abbreviated or preferred alias exists, but some other alias type was input, return the input alias. If no alias exists, return the base street name.<li data-bbox="597 930 1429 1018">• Return abbreviated, preferred, alias or base. Return the abbreviated alias. If no abbreviated alias exists, return the Preferred alias. If neither exists, return only the base street name

Option Name	Description
Dual address	<p>If the input file contains dual addresses (one a conventional address, a second containing a PO Box address), this field determines the order to use to process and match the addresses. If the selected address is valid, processing stops. If the selected address does not validate, processing attempts to code the secondary address.</p> <ul style="list-style-type: none"> • Above city and ZIP Code. The address line closest to the last line in the address is given the highest priority in the match process. Any address line above the last line is not used for matching. Default. • Line 1 is given preference. The first line in the dual address is given the highest priority in the match process. • Line 2 is given preference. The second line in the dual address is given the highest priority in the match process. • Conventional is given preference. The conventional address is given the highest priority in the match process. • PO Box is given preference. The PO Box is given the highest priority in the match process. • The first valid address is given preference. The first valid address (in the order Address line 1 and then Address line 2) is given the highest priority in the match process. <p>Note: When dual addresses are contained on a single line and the CASS flag is enabled, the USPS address type priority is used in the following order:</p> <ol style="list-style-type: none"> 1. PO Box 2. Firm 3. Highrise 4. Street 5. Rural Route 6. General Delivery
VeriMove data block	<p>The VeriMove data block option determines whether to return 250-bytes of additional information codes to the output file. This additional information can be used as input to the Pitney Bowes VeriMove move update product.</p>

Additional Processing

Global Address Validation uses the default options settings to define additional processing options.

Table 52: Additional Processing Options

Option Name	Description
Delivery Point Validation (DPV)	<p>Perform Delivery Point Validation (DPV) processing. USPS CASS regulations require DPV processing. If you do not perform DPV processing, Global Address Validation does not generate a USPS Form 3553 (CASS Summary Report). The default is disabled.</p> <p>Note: When DPV is disabled, all DPV options are also disabled and display in a grayed out mode.</p> <p>Note: If you are performing Global Address Validation US Addressing processing outside of the physical United States, you must disable the Delivery Point Validation (DPV) option. You will not be able to run in a USPS CASS-certified mode.</p>
Tie Break	<p>The USPS allows DPV processing to be used as a tie breaker for matching inexact street records. If only one of the records in a tie is delivery point validated, a match is allowed to the inexact record. When processing results in an inexact match due to the input address directional, DPV processing can be used as a tie breaker if only one of the records is found to be delivery point validated and the delivery point validated record does not violate the cardinal direction rule. The default is enabled.</p> <p>USPS CASS regulations require DPV Tie Break processing to generate the USPS Form 3553 (USPS CASS Summary Report).</p>
Commercial Mail Receiving Agency (CMRA)	<p>Perform Commercial Mail Receiving Agency (CMRA) processing. A private company offering mailbox rental services to individuals and businesses is a Commercial Mail Receiving Agency (CMRA). The default is disabled.</p>
PO Box as Street Address (PBSA)	<p>Perform DPV P.O. Box Street Address (PBSA) processing. A PBSA address is a street address that represents a USPS P.O. Box. Use the PBSA table to identify PBSA addresses. Return the PBSA result to the output. The default is disabled.</p>
No-Stat	<p>Perform DPV No-Stat processing. Use the No-Stat table to identify deliveries that are not valid for Computerized Delivery Sequence (CDS) pre-processing. Return the proper No-Stat code to the output. The default is disabled.</p>
Vacant	<p>Perform DPV Vacant Table processing. Use the Vacant Table to identify delivery addresses that have been active in the past but, according to USPS data, have not been occupied within the last 90 days. Return the proper Vacant code to the output. The default is disabled.</p>

Option Name	Description
Door Not Accessible (DNA)	Perform DPV Door Not Accessible (DNA) processing. Use the DNA Table to identify delivery addresses where carriers cannot knock on the door for mail delivery or where carriers cannot physically access a residence/building such as rural/highway contract route (HCR), long driveway, or gated community. Return the proper DNA code to the output. The default is disabled.
Throwback	Perform DPV P.O. Box Throwback processing. Use the P.O. Box Throwback Table to identify a delivery point that is a street address where mail is not delivered. Instead, delivery is made to the customer's P.O. Box address. Return the P.O. Box Throwback result to the output. The default is disabled.
No Secure Location (NSL)	Perform DPV No Secure Location (NSL) processing. Use the NSL table to identify delivery locations that are not secure. For example, a carrier can access a door but cannot leave a package due to security concerns. The NSL designation alerts mailers to locations where businesses are closed on certain days and locations without mail receptacles (for example, a storefront). Return the NSL result to the output. The default is disabled.
Enhanced Line of Travel (eLOT)	Assign enhanced Line of Travel (eLOT) codes. The default is disabled.
Early Warning System (EWS)	Perform Early Warning System (EWS) processing. Perform Early Warning System (EWS) processing. New address information that is in use, but not yet available on the ZIP + 4 File, can be found as part of the USPS Early Warning System (EWS). The USPS requires all CASS-certified software to verify addresses that are not found in the current ZIP + 4 File against the USPS EWS File. If an address is found in the EWS File, the address is not matched to any similar addresses in the current ZIP + 4 File. Instead, the input address fails and is not coded until the ZIP + 4 File is updated with the correct address from the USPS EWS File. The default is disabled.
Residential Delivery Indicator (RDI)	Perform Residential Delivery Indicator (RDI) processing. The default is disabled. Note: If you are performing Global Address Validation US Addressing processing outside of the physical United States, you must disable the Residential Delivery Indicator (RDI) option. You will not be able to run in a USPS CASS-certified mode.
LACSLink	Perform LACSLink (Locatable Address Conversion System) processing. USPS CASS regulations require LACSLink processing. If you do not perform LACSLink processing, Global Address Validation does not generate a USPS Form 3553 (CASS Summary Report). The default is disabled. Note: If you are performing Global Address Validation US Addressing processing outside of the physical United States, you must disable the LACSLink option. You will not be able to run in a USPS CASS-certified mode.

Option Name	Description
SuiteLink	<p>Perform SuiteLink processing. USPS CASS regulations require SuiteLink processing. If you do not perform SuiteLink processing, Global Address Validation does not generate a USPS Form 3553 (CASS Summary Report). The default is disabled.</p> <p>Note: If you are performing Global Address Validation US Addressing processing outside of the physical United States, you must disable the SuiteLink option. You will not be able to run in a USPS CASS-certified mode.</p>
Return SuiteLink secondary	<p>Indicate how to return secondary information when SuiteLink secondary information is available.</p> <ul style="list-style-type: none"> • Both SuiteLink and input. Return both SuiteLink and input secondary information. Default. • SuiteLink only. Return SuiteLink secondary only. Do not return input secondary. • Input only. Return input secondary only. Do not return SuiteLink secondary. • None. Do not return SuiteLink secondary or input secondary.

CASS Mailer Information

The Mailer's name and address that displays on the USPS Form 3553 (CASS Summary Report). This information is required if you are running DPV and optional if you are not running DPV.

Table 53: CASS Mailer Information

Option Name	Description
Name	The Mailer's name displays in section D box 3 on the USPS Form 3553 (CASS Summary Report).
Address	Mailer's address. This information displays in section D box 3 on the USPS Form 3553 (CASS Summary Report).
Address2	Additional address line for Mailer's address displays in section D box 3 on the USPS Form 3553 (CASS Summary Report).
Address3	Additional address line for Mailer's address displays in section D box 3 on the USPS Form 3553 (CASS Summary Report).
Address4	Additional address line for Mailer's address displays in section D box 3 on the USPS Form 3553 (CASS Summary Report).

Option Name	Description
City, State, ZIP Code	The Mailer's city, state, and ZIP Code information displays in section D box 3 on the USPS Form 3553 (CASS Summary Report).

Multiple Address Line Options

Global Address Validation uses the multiple address line options settings to define the options specific to multiple address line processing. To specify the format of your returned lines address, select three options (one for each returned line and a special option).

Table 54: Multiple Address Line Options

Option Name	Description
Return Line 1	<p>Specify the format for returned line 1.</p> <ul style="list-style-type: none"> • Return the first valid line from the top. • Return the first firm line from top. • Return the first valid line above the city line. • Return the street address line above the city line. • Return the PO box or RR/HC line above the city line. • Return the best street or PO box line from top. If not found, the first firm or rural route line from top. When selecting this option for return line 1, processing selects from the top down in this order: <ol style="list-style-type: none"> 1. First PO box line or complete address. 2. First street line with a range but no suffix. 3. First Street line with a suffix but no range. 4. First rural route line. 5. First firm type.
Return Line 2	<p>Specify the format for returned line 2.</p> <ul style="list-style-type: none"> • Return a blank line. • Return the first valid line from the top. • Return the second valid line from the top. • Return the first firm line from top. • Return the second half of the combined address line if the first half is returned in line 1. • Return the first valid line above the city line. • Return the second valid line above city line. • Return the street address line above the city line. • Return the PO box or RR/HC line above the city line. • Return the first valid line above city line. If that criteria is not met resulting in a blank second line, return the topmost line not used in return line 2.

Option Name	Description
Special Options	<p>Specify special options for returned lines.</p> <ul style="list-style-type: none"> • Use all special options for returned lines. • Do not use any special options for returned lines. • Add a range of "0" to street lines without a range. For example, Main St becomes 0 Main St. • Separate combined address lines.
Return Line Order	<p>Specify the order for returning the standardized lines.</p> <ul style="list-style-type: none"> • 0 Firm line. • 1 PO Box address line. • 2 Address line with both a range and a suffix word. • 3 Address line with a range but no suffix, Address line with a suffix but no range. • 4 Rural route address line. • 5 Personal name, Firm name (w/o firm words), Unidentified. • 6 Apartment type line. • 7 Possible city line. • 8 City line. • 9 Ignore this line. • B Box address line following a rural route address line. • M Military address line. • N Best address line 1, best address line 2, city state, firm. URB and ZIP Code are returned in separate fields. The default is N. • R Rural route address line preceding a box line.
Do not concatenate lines beginning with #	Check Do not concatenate lines beginning with # if you do not want to concatenate lines beginning with a # to existing address lines.
Do not recognize periods (.) as valid characters	Check Do not recognize periods (.) as valid characters if you do not want to recognize periods as valid characters (periods should be removed before scanning address lines).
Do not concatenate dangling lines	Check Do not concatenate dangling lines if you do not want to concatenate one-word lines to address lines.
Do not merge secondary or PMB	Check Do not merge secondary or PMB if you do not want to merge a separated second unit and PMB information.
Do not identify FirmName	Check Do not identify FirmName if you do not want to perform firm name processing.

Option Name	Description
Do not identify CitySubdivision	Check Do not identify CitySubdivision if you do not want to perform Urbanization name (Puerto Rico) processing.
Do not identify LastLine	Check Do not identify LastLine if you do not want to perform last line (City, State, or ZIP Code) processing.

Log Level Options

Global Address Validation uses the log level options settings to define message logging.

Table 55: Log Level Options

Option Name	Description
Log level	<p>The level of the messages to log.</p> <ul style="list-style-type: none"> • No messages. • Critical messages • Error messages • Warning messages • Info messages • Debug messages

Input

Global Address Validation uses an address as input. All addresses use this format regardless of the address's country. To obtain the best performance and address match, your input address lists should be as complete as possible, free of misspellings and incomplete addresses, and as close to postal authority standards as possible. Most postal authorities have websites that contain information about address standards for their particular country.

Note: The country name or two- or three- character country ISO code is optional. If you omit the country, Global Address Validation returns the best available candidates for the **Default Country** selected on the **Default Options** tab. For a list of ISO codes, see [ISO Country Codes and Coder Support](#).

Table 56: Global Address Validation Input

Field Name	Format	Description
FirmName	String	Company, firm name, or place name. For example, PITNEY BOWES.

Field Name	Format	Description
AddressLine1	String	The first address line. For example, 34 GLENVIEW ROAD MOUNT KURNING-GAI NSW 2080 . AddressLine1 can also contain a dual address (contains more than one mailable address). For example, the dual address PO BOX 3220 STN C 181 QUEEN STREET OTTAWA ON K1Y1E4 contains both a PO Box and a street address.
AddressLine2	String	The second address line (USA only).
AddressLine3	String	The third address line (USA only).
AddressLine4	String	The fourth address line (USA only).
AddressLine5	String	The fifth address line (USA only).
AddressLine6	String	The sixth address line (USA only).
LastLine	String	The last line of the address. For example, 34 GLENVIEW ROAD MOUNT KURNING-GAI NSW 2080 . Note: Global Address Validation only considers the LastLine information when individual components such as City and PostalCode are not provided.
City	String	The city or town name. To produce the best match results, your input address should use the official city name.
CitySubdivision	String	The name of one of the following depending on the country: <ul style="list-style-type: none"> • Not used—AUS, AUT, BEL, CHE, DEU, DNK, FIN, FRA, IRL, MYS, NLD, NOR, POL, SWE • Dissemination Area and Enumeration Area (DA and EA)—CAN • Locality—BRA, GBR, GRC, ITA, ESP • Suburb—NZL • Urbanization name (Puerto Rico)—USA

Field Name	Format	Description
StateProvince	String	<p>The name of the state or province depending on the country:</p> <ul style="list-style-type: none"> • Not used—BEL, CHE, DNK, IRL, NLD, NOR • Bundesland—DEU • Province—CAN • Province (voivodship)—POL • Region—AUT, ESP, FRA, GBR, GRC, NZL • Region (län)—FIN • Region (lan)—SWE • State—AUS, BRA, USA • State (negeri)—MYS
StateProvinceSubdivision	String	<p>The name of the state or province subdivision depending on the country:</p> <ul style="list-style-type: none"> • Not used—AUT, BRA, CAN, FIN, GBR, MYS • Department—FRA • District—GRC • District (fylke/counties)—NOR • District (powiat)—POL • Kommun—SWE • Kreis—DEU • Local Government Authority (LGA)—AUS • Province—BEL, CHE, DNK, ESP, IRL, ITA, NLD • Region—NZL
PostalCode	String	The postal code in the appropriate format for the country.
Country	String	The country name of the two- or three-character ISO country code. This field is optional. If you omit the country, Global Address Validation returns the best available candidates for the Default Country selected on the Default Options tab. For a list of ISO codes, see ISO Country Codes and Coder Support .

Output

Global Address Validation output is determined by the output options you select.

Standard Address Output

Standard address output consists of address lines which correspond to how the address would appear on an address label. City, state or province, postal code, and other data are also included in the standard address output.

Table 57: Standard Address Output

Field Name	Format	Description
AdditionalInputData	String	Additional input data entered that was not used for matching.
AddressBlock1-2	String	<p>The AddressBlock output fields contain a formatted version of the standardized or normalized address as it would be printed on a physical mailpiece. Global Address Validation formats the address into address blocks using postal authority standards. Each line of the address is returned in a separate address block field. There can be up to two address block output fields: AddressBlock1 and AddressBlock2.</p> <p>AddressBlock1 includes:</p> <ul style="list-style-type: none"> • PO Box—CAN, FRA, GBR • Firm Name • Unit Number • Unit Type • House Number • Street Name <p>AddressBlock2 includes:</p> <ul style="list-style-type: none"> • Locality • Town • Postal Code • County • State <p>For example, this input address:</p> <p>AddressLine1: 34 Glenview Road City: Mount Kurnung-Gai StateProvince: NSW PostalCode: 2080</p> <p>Results in this address block output:</p> <p>AddressBlock1: 34 Glenview Road AddressBlock2: Mount Kurnung-Gai NSW 2080</p> <p>In this example, the input address includes a PO Box (CAN, FRA, and GBR) and the "Prefer PO Box over street" option is selected:</p> <p>AddressLine1: 1 Great Lawn PO Box 10916 CM5 5AL</p> <p>Results in this address block output:</p> <p>AddressBlock1: PO Box 10916 AddressBlock2: ONGAR CM5 5AL</p>

Field Name	Format	Description
AddressBlock3-10	String	<p>Additional AddressBlock fields for USA addresses. For USA addresses, starting from AddressBlock1 the data includes:</p> <ul style="list-style-type: none"> • Firm Name • URB name • Extra address line information • Required address line information • Last line
AddressLine1	String	<p>The first address line.</p> <p>For example, 34 GLENVIEW ROAD MOUNT KURNING-GAI NSW 2080.</p> <p>In an example of a dual address, the address PO BOX 3220 STN C 181 QUEEN STREET OTTAWA ON K1Y1E4 contains both a PO Box and a street address.</p> <p>If the option "Prefer PO Box over street" is enabled, PO BOX 3220 STN C displays in this field.</p> <p>If the option "Prefer PO Box over street" is not enabled, 181 QUEEN STREET displays in this field.</p> <p>Global Address Validation supports PO Box matching for these countries:</p> <ul style="list-style-type: none"> • Canada (CAN) • France (FRA) • United Kingdom (GBR) • United States (USA)
AddressLine2	String	The second address line (USA only).
ApartmentLabel	String	The flat or unit type. For example, 39 Acacia Avenue Flat B .
ApartmentNumber	String	The flat or unit number. For example, 39 Acacia Avenue Flat B .
Building	String	The name of a building.
City	String	The city or town name. Your input address should use the official city name to produce the best match results.
City.Matched	String	<p>The status of the city match.</p> <p>True Matched on the city name.</p> <p>False Did not match on the city name.</p>

Field Name	Format	Description
CitySubdivision	String	The name of one of the following depending on the country: <ul style="list-style-type: none"> • Not used—AUS, AUT, BEL, CHE, DEU, DNK, FIN, FRA, IRL, MYS, NLD, NOR, POL, SWE • Dissemination Area and Enumeration Area (DA and EA)—CAN • Locality—BRA, GBR, GRC, ITA, ESP • Suburb—NZL • Urbanization name (Puerto Rico)—USA
CitySubdivision.Matched	String	The status of the match on city subdivision. <p>True Matched on the city subdivision.</p> <p>False Did not match on the city subdivision.</p>
Confidence	String	The level of confidence assigned to the address being returned. Range is from zero (0) to 100. Zero indicates failure. 100 indicates a very high level of confidence that the match results are correct.
Country	String	The country in the language or code specified in the Country format option. For a list of ISO codes, see ISO Country Codes and Coder Support .
Country specific fields	String	The country specific output information. To include the country specific output information in the output, check the Country specific fields output option.
FirmName	String	The name of a company.
Firmname.Matched	String	The status of the match on firm name. <p>True Matched on the firm name.</p> <p>False Did not match on the firm name.</p>
HouseNumber	String	The house number or PO Box number (CAN, FRA, UK). For example, 39 Acacia Avenue or PO Box 3220 .
Housenumber.Matched	String	The status of the match on house number. <p>True Matched on the house number.</p> <p>False Did not match on the house number.</p>
LeadingDirectional	String	The leading directional. For example, 123 E Main St Apt 3.

Field Name	Format	Description
MatchOnAllStreetFields	String	The status of the match on all street fields. True Matched on all street fields. False Did not match on all street fields.
MatchOnStreetDirectional	String	The status of the match on street directional. True Matched on the street directional. False Did not match on the street directional.
MatchScore	String	Reserved for future use.
MultimatchCount	String	If the address was matched to multiple candidate addresses in the reference data, this field contains the number of candidate matches found.
PostalCode	String	The postal code for the address. The format of the postal code varies by country.
PostalCode.AddOn	String	The second part of a postal code. This field is not used by most countries.
Postalcode.Matched	String	The status of the match on postal code. True Matched on the postal code. False Did not match on the postal code.
Principality	String	An area within a country. For example, England, Scotland, and Wales are principalities. This field will normally be blank.
ProcessedBy	String	The Global Addressing Module stage name.
Result Code	String	The field-level result codes. Field-level result codes describe how each address element was processed. Field-level result codes are returned in the qualifier "Result". For example, the field-level result code for City is contained in City.Result. For a complete listing of result code output fields, see Result Codes.

Field Name	Format	Description
StateProvince	String	<p>The name of one of the state or province depending on the country:</p> <ul style="list-style-type: none"> • Not used—BEL, CHE, DNK, IRL, NLD, NOR • Bundesland—DEU • Province—CAN • Province (voivodship)—POL • Region—AUT, ESP, FRA, GBR, GRC, NZL • Region (län)—FIN • Region (lan)—SWE • State—AUS, BRA, USA • State (negeri)—MYS
StateProvince.Matched	String	<p>The status of the match on state or province.</p> <p>True Matched on the state or province.</p> <p>False Did not match on the state or province.</p>
StateProvinceSubdivision	String	<p>The name of the state or province subdivision depending on the country.</p> <ul style="list-style-type: none"> • Not used—AUT, BRA, CAN, FIN, GBR, MYS • County—USA • Department—FRA • District—GRC • District (fylke/counties)—NOR • District (powiat)—POL • Kommun—SWE • Kreis—DEU • Local Government Authority (LGA)—AUS • Province—BEL, CHE, DNK, ESP, IRL, ITA, NLD • Region—NZL
StateProvinceSubdivision.Matched	String	<p>The status of the match on state or province subdivision.</p> <p>True Matched on the state or province subdivision.</p> <p>False Did not match on the state or province subdivision.</p>
StreetName	String	<p>The name of street where the property is located or "PO Box" to indicate the input record matched to a PO Box. For example, 123 E Main St or PO Box 3220.</p>
StreetName.Matched	String	<p>The status of the match on street name.</p> <p>True Matched on the street name.</p> <p>False Did not match on the street name.</p>

Field Name	Format	Description
StreetType	String	The street type. For example, 123 E Main St Apt 3. In another example, 123 E Main Ave Apt 3. These are two entirely different entities. Using street types adds precision to your data.
StreetType.Matched	String	The status of the match on street type. True Matched on the street type. False Did not match on the street type.
TrailingDirectional	String	The trailing directional. For example, 123 Pennsylvania Ave NW .
VendorCode	String	The vendor code. This field is only available if you select the output option " Country specific fields ".

Parsed Input

The Global Address Validation output can include the input address in parsed form. This type of output is referred to as "parsed input." Parsed input fields contain the address data that was used as input regardless of whether or not Global Address Validation validated the address. This information is not available when the address is validated at the postal / city level. It is available when an address gets validated at the street level. To include parsed input fields in the output, select the **Parsed address** output option.

Table 58: Parsed Input

Field Name	Format	Description
DualAddressParsed.Input	String	<p>A dual address is an address that contains more than one mailable address. For example, an address that contains both a PO Box and a street address is considered a dual address. When a dual address line is entered as input, this field contains the address line that is not used for AddressBlock1.</p> <p>If a PO Box (CAN, FRA, and UK) and a street address are entered as input and the option "Prefer PO Box over street" is enabled, the PO Box number is returned in the AddressLine1 field and AddressBlock1 fields and the street address is returned in the DualAddressParsed.Input field.</p> <p>If a PO Box (CAN, FRA, and UK) and a street address are entered as input and the option "Prefer PO Box over street" is not enabled, the street address is returned in the AddressLine1 field and AddressBlock1 fields and the PO Box is returned in the DualAddressParsed.Input field.</p>

Field Name	Format	Description
ParsedAddressLine1.Input	String	The first address line passed on input. For some countries (CAN, FRA, and UK), when the "PO Box over street" option is activated, this field contains PO Box.
ParsedApartmentLabel.Input	String	The unit designator passed on input.
ParsedApartmentNumber.Input	String	The unit number passed on input.
ParsedCity.Input	String	The city/locality/suburb name passed on input.
ParsedCitySubdivision.Input	String	The urbanization name passed on input.
ParsedCountry.Input	String	The country passed on input.
ParsedHouseNumber.Input	String	The house number passed on input. For example, 123 E Main St Apt 3.
ParsedPlaceName.Input	String	The place or firm name passed on input.
ParsedPostCodeAddOn.Input	String	The second part of a postal code passed on input. This field is not used by most countries.
ParsedPostCodeBase.Input	String	The postal code passed on input. For some countries, this field contains the first part of the postal code and the ParsedPostCodeAddOn.Input contains the second part of the postal code.
ParsedPostStreetType.Input	String	The street type passed on input. For example, 123 E Main St Apt 3.
ParsedPreStreetType.Input	String	The predirectional type passed on input. For example, 123 E Main St Apt 3.
ParsedStateProvince.Input	String	The name of one of the state or province depending on the country passed on input.
ParsedStateProvinceSubdivision.Input	String	The subdivision passed on input.

Precision

The Global Address Validation output can include the precision code that describes the precision of the address match for the input address. To include the precision code in the output, select the **Precision** output option.

Note: The "Precision code counts" section on the Match Analysis Report only displays when you check the "Precision" output option.

Table 59: Precision

Field Name	Format	Description
PrecisionCode	String	

Field Name	Format	Description
		A code describing the precision of the address match.
		The matches in the Z category indicate that a match was made at the postal code level.
	Z1	Match to ZIP Code™ or postal code 1.
	Z2	Match to ZIP + 2 or partial match to postal code 2.
	Z3	Match to ZIP + 4® or postal code 2.
		The matches in the G category indicate that the record was matched to an area name.
	G1	Match to state/province (area name 1).
	G2	Match to country/region (area name 2).
	G3	Match to city/town (area name 3).
	G4	Match to suburb/village (area name 4).
		The matches in the B category indicate that the record was matched to a PO Box.
	B1	Matched to an unvalidated PO Box. Although there is enough information in the record to identify this as a PO Box, not enough information exists to determine whether the PO Box number is valid.
	B2	Matched to a validated PO Box.
		The matches in the S category indicate that the record was matched to a single address candidate.
	S0	Single match; however, no coordinates are available. This is a very rare occurrence. Parts of the address may have matched the source data.
	S1	Single match to a ZIP Code™ or postal code 1 level. This is the same quality match as a Z1 result.
	S2	Single match to a ZIP + 2 or partial match to postal code 2 level. This is the same quality match as a Z2 result.
	S3	Single match to a ZIP + 4® or postal code 2 level. This is the same quality match as a Z3 result.
	S4	Single match at the street level.
	S5	Single match to the street address. Because only the street segment data is available, the interpolation is not as accurate as an S7 return. The S5 code is followed by letters and dashes indicating match precision.
	S6	Single match to a point located at a ZIP centroid.
	S7	Single match to a street address that was interpolated between houses.

Field Name	Format	Description
	S8	Single match to the street address or house number.
	SC	Single match at the house-level that has been projected from the nearest segment.
	SG	Single match with point at the center of a locality (<code>areaName3</code>) or Locality level geocode derived from topographic feature. An <code>SG</code> result code is associated with GNAF Reliability Level 5 (locality or neighborhood) or with Level 6 (unique region). (Australia addresses only.)
	SL	Single match to a sublocality (block or sector) street level match. An <code>SL</code> result code also requires a match on other geographic input fields (city, district, or state). (India addresses only.)
	SX	Single match to a point located at a street intersection.

For S (street matched) precision codes, eight additional characters describe how closely the address matches an address in the database. The characters appear in the order shown.

For example, the result code `S5--N-SCZA` represents a single match that matched the street name, street suffix direction, town, and postal code. The dashes indicate that there was no match on house number, street prefix direction, or thoroughfare type. The match came from the Street Range Address database. This record would be matched at the street address level of the match candidate.

Field Name	Format	Description
	H	House number match.
	P	Street prefix (pre-directional). P is present if any of these conditions are satisfied: <ul style="list-style-type: none"> The candidate pre-directional matches the input pre-directional. The candidate post-directional matches the input pre-directional after pre- and post-directionals are swapped. The input does not have a pre-directional.
	N	Street name match.
	T	Street/thoroughfare type match.
	S	Street suffix (post-directional). <ul style="list-style-type: none"> The candidate post-directional matches the input post-directional. The candidate pre-directional matches the input post-directional after pre- and post-directionals are swapped. The input does not have a post-directional.
	C	City or town name.
	Z	Postal code match.
	A	Addressing dataset match.
	U	Custom user dictionary match.

Single Match 'S' Precision Codes

The following table shows the support for the *s* category precision codes by country. For more information on the 's' precision codes, see [Table 59: Precision](#) on page 541. These descriptions apply to the vast majority of the countries. The exceptions for Australia and Canada are described in the sections that follow this table.

A bullet "*" indicates the *s* code is supported. A blank cell indicates the *s* code is not supported.

Country Name	S8	S7	S6	S5	S4	S3	S2	S1	S0	SX	SC	SG	SL
Australia (AUS)	*	*		*	*				*			*	
Canada (CAN)	*	*		*	*	*		*	*		*		
Denmark (DNK)	*	*		*	*					*			

Country Name	S8	S7	S6	S5	S4	S3	S2	S1	S0	SX	SC	SG	SL
Germany (DEU)	•	•		•	•					•			
Great Britain (GBR)	•	•		•	•				•	•			
India (IND)	•				•								•
New Zealand (NZL)	•	•		•	•					•			
All other countries	•	•		•	•				•	•	•		

Australia — 'S' Precision Code Descriptions

The following table provides 'S' precision code descriptions for Australia.

Result Code	Description
S8	Street level geocoded candidates return a result code beginning with the letter S. The second character in the code indicates the positional accuracy of the resulting point for the geocoded record.
S8	Single match, point located at either the single point associated with an address point candidate or at an address point candidate that shares the same house number. No interpolation is required.
S8.....G	The S8.....G result code is used for single matches with GNAF Reliability levels of 1 or 2 (the highest level of GNAF Reliability).
S7	Single match, located at an interpolated point along the candidate's street segment. When the potential candidate is not an address point candidate and there are no exact house number matches among other address point candidates, the S7 result is returned using address point interpolation.
S7.....G	The S7.....G result code is used for single matches with GNAF Reliability level of 3.
S5	Single match, point located at a street address position.

Result Code	Description
S4	Single match, point located at the center of a shape point path (shape points define the shape of the street polyline).
S4.....G	The S4.....G result code is used for single matches with a GNAF Reliability level of 4 (associated with a unique road feature).
S0	Single match, however, no coordinates are available (this is a very rare occurrence).
SX	Single match with the point located at street intersection.
SC	Single match where the original point has been moved a specified distance (usually along a perpendicular line) toward or away from the associated street segment. This result code can be returned only when both a point geocoding dataset and a street segment geocoding dataset are available and when the centerline offset feature is used.
SG	Single match with point at the center of a locality (<code>areaName3</code>) or Locality level geocode derived from topographic feature. An SG result code is associated with GNAF Reliability Level 5 (locality or neighborhood) or with Level 6 (unique region).

Canada — 'S' Precision Code Descriptions

The following table provides 'S' precision code descriptions for Canada.

Result Code	Description
Street level geocoded candidates return a result code beginning with the letter S. The second character in the code indicates the positional accuracy of the resulting point for the geocoded record.	
S8	Single match, point located at either the single point associated with an address point candidate or at an address point candidate that shares the same house number. No interpolation is required.
S7	Single match, located at an interpolated point along the candidate's street segment. When the potential candidate is not an address point candidate and there are no exact house number matches among other address point candidates, the S7 result is returned using address point interpolation.
S5	Single match, point located at a street address position.
S4	Single match, point located at the center of a shape point path (shape points define the shape of the street polyline).

Result Code	Description
s3	Single match, point located at postal centroid of FSALDU.
s1	Single match, point located at postal centroid of FSA.
s0	Single match, however, no coordinates are available (this is a very rare occurrence).
sc	Single match where the original point has been moved a specified distance (usually along a perpendicular line) toward or away from the associated street segment. This result code can be returned only when both a point geocoding dataset and a street segment geocoding dataset are available and when the centerline offset feature is used.

Result Codes

The result codes provide information on how Global Address Validation processed U.S. addresses.

Table 60: Result Codes

Field Name	Format	Description
ApartmentLabel.Result	String	<p>The result codes for the apartment designator (for example, STE or APT).</p> <ul style="list-style-type: none"> - The input field was empty and supposed to be empty. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.

Field Name	Format	Description
ApartmentNumber.Result	String	<p>The result codes for the apartment number (for example, Apt 3).</p> <ul style="list-style-type: none"> - The input field was empty and supposed to be empty. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.
City.Result	String	<p>The result codes for the validated city name.</p> <ul style="list-style-type: none"> - The input field was empty and supposed to be empty. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.

Field Name	Format	Description
CitySubdivision.Result	String	<p>The result codes for the validated urbanization name. This is primarily used for Puerto Rico addresses.</p> <ul style="list-style-type: none"> - The input field was empty and supposed to be empty. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.
FirmName.Result	String	<p>The result codes for the validated firm or company name.</p> <ul style="list-style-type: none"> - The input field was empty and supposed to be empty. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.

Field Name	Format	Description
HouseNumber.Result	String	<p>The result codes for the House number (for example, 123 E Main St Apt 3).</p> <ul style="list-style-type: none"> - The input field was empty and supposed to be empty. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.
LeadingDirectional.Result	String	<p>The result codes for the leading directional (for example, 123 E Main St Apt 3).</p> <ul style="list-style-type: none"> - The input field was empty and supposed to be empty. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.
POBox.Result	String	<p>The result codes for the Post office box number.</p> <ul style="list-style-type: none"> Blank Not applicable. C Corrected. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.

Field Name	Format	Description
PostalCode.Result	String	<p>The result codes for the postal code. For U.S. addresses, this is the ZIP Code.</p> <p>Blank Not applicable.</p> <p>A Appended. The field was added to a blank input field.</p> <p>C Corrected.</p> <p>D Dropped. The field provided on input was removed.</p> <p>M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>
PostalCode.Source	String	<p>The result codes for the postal code source.</p> <p>Blank Not applicable.</p> <p>ZIPMOVE The ZIP Code™ in the input address was corrected because the USPS® redrew ZIP Code™ boundaries and the address is now in a different ZIP Code™.</p>
PostalCode.Type	String	<p>The result codes for the postal code type.</p> <p>Blank Not applicable.</p> <p>P Post office box only.</p> <p>U Unique ZIP Code™.</p> <p>M Military ZIP Code™.</p>
RRHC.Result	String	<p>The result codes for the rural route/highway contract indicator.</p> <p>Blank Not applicable.</p> <p>C Corrected.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>

Field Name	Format	Description
RRHC.Type	String	The result codes for the rural route/highway contract indicator. Blank Not applicable. HC Highway contract route. RR Rural route.
StateProvince.Result	String	The result codes for the state or province name. Blank Not applicable. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.
StreetName.Alternate.Type	String	The alternate street name type. Blank Not applicable. A Alias (other). B Base street. D Alternate street. P Preferred alias. X Abbreviated alias.

Field Name	Format	Description
StreetName.Result	String	<p>The result codes for the street name (for example, 123 E Main St Apt 3).</p> <p>Blank Not applicable.</p> <p>A Appended. The field was added to a blank input field.</p> <p>C Corrected.</p> <p>D Dropped. The field provided on input was removed.</p> <p>M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>
StreetName.Type	String	<p>The street name type.</p> <p>Blank Not applicable.</p> <p>A Alias (other).</p> <p>B Base street.</p> <p>D Alternate street.</p> <p>P Preferred alias.</p> <p>X Abbreviated alias.</p>
StreetSuffix.Result	String	<p>The result codes for the street name (for example, 123 E Main St Apt 3).</p> <p>Blank Not applicable.</p> <p>A Appended. The field was added to a blank input field.</p> <p>C Corrected.</p> <p>D Dropped. The field provided on input was removed.</p> <p>M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>

Field Name	Format	Description
TrailingDirectional.Result	String	The result codes for the trailing directional (for example, 123 Pennsylvania Ave NW). Blank Not applicable. A Appended. The field was added to a blank input field. C Corrected. D Dropped. The field provided on input was removed. M Multiple. The input address matched multiple records in the postal database. Each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. V Validated. The data was confirmed correct and remained unchanged from input.

Input Address

The Global Address Validation output can include the input address. To include the input address, select the **Input address** output option.

Table 61: Input Address

Field Name	Format	Description
AddressLine1.Input	String	The first address line passed on input.
AddressLine2.Input	String	The second address line passed on input (USA only).
City.Input	String	The city/locality/suburb name passed on input.
CitySubdivision.Input	String	The city/town subdivision passed on input.
LastLine.Input	String	The last line passed on input.
StateProvince.Input	String	The state/province passed on input.
StateProvinceSubdivision.Input	String	The state/province subdivision passed on input.
PostalCode.Input	String	The postal code passed on input.

Field Name	Format	Description
Country.Input	String	The country passed on input.
FirmName.Input	String	The firm name passed on input.

Country Specific Fields

The Global Address Validation output can include country specific fields. To include country specific fields in the output, select the **Country specific fields** output option.

Table 62: Australia (AUS) Country Specific Fields

Field Name	Format	Description
AUS.Parcel.ID	String	The GNAF parcel identifier.
AUS.Pid	String	The GNAF Persistent Identifier (GNAF PID) is a 14-character alphanumeric string that uniquely identifies each GNAF address. The PID is constructed from a combination of the major address fields of the GNAF Dictionary. For example, GAACT718519668 .
AUS.Principal.Pid	String	The Persistent Identifier of the principal address.
AUS.Address.Class	String	The GNAF address classification.
AUS.SA1	String	The GNAF Statistical Area Level 1 (SA1) identifier.
AUS.Level.Number	String	The number of a floor or level in a multi-story building. For example, Floor 2 , 17 Jones Street.

Table 63: Canada (CAN) Country Specific Fields

Field Name	Format	Description
CAN.Census.CD	String	The Census Division (CD) in which the address is located. For more information about Census Divisions, see: http://www12.statcan.ca/english/census01/Products/Reference/dict/geo008.htm on the Statistics Canada website.

Field Name	Format	Description
CAN.Census.CMA	String	The Census Metropolitan Area (CMA) in which the address is located. For more information about Census Metropolitan Areas, see http://www12.statcan.ca/english/census01/Products/Reference/dict/geo009.htm on the Statistics Canada website.
CAN.Census.CSD	String	The Census Subdivision (CSD) in which the address is located. For more information about Census Subdivisions, see http://www12.statcan.ca/english/census01/Products/Reference/dict/geo012.htm on the Statistics Canada website.
CAN.Census.CT	String	The Census Tract (CT) in which the address is located. For more information about Census Tracts, see http://www12.statcan.ca/english/census01/Products/Reference/dict/geo013.htm on the Statistics Canada website.
CAN.Census.DA	String	The Dissemination Area (DA) in which the address is located. For more information about Dissemination Areas, see http://www12.statcan.ca/english/census01/Products/Reference/dict/geo021.htm on the Statistics Canada website.

Table 64: India (IND) Country Specific Fields

Field Name	Format	Description
IND.Is.Rural	String	Indicates whether an address is located in a rural region (village).
IND.POI.Category	String	Point of interest category. This field describes the type of POI, such as a bank, ATM, or restaurant.
IND.ExtendedResultCode	String	Block information.
IND.SubLocality	String	The municipal division below locality level.

Table 65: Ireland (IRL) Country Specific Fields

Field Name	Format	Description
IRL.Eircode	String	The Eircode for the address. The Eircode is a seven character alpha-numeric code made up of two parts. Routing key The first three characters define a principal post town span of delivery. Unique Identifier The last four characters uniquely identify each residential and business address.

Table 66: Italy (ITA) Country Specific Field

Field Name	Format	Description
ITA.Historical.Postcode	String	The previous postal code for this address.

Table 67: Japan (JAP) Country Specific Fields

Field Name	Format	Description
JPN.BANCHI	String	The block number.
JPN.CHOMOKU	String	The city block number.
JPN.CHOAZA	String	The number for a group of city blocks.
JPN.GO	String	The house number.
JPN.JUSHOCODE	String	A point ID that represents a unique address.

Table 68: Netherlands (NLD) Country Specific Field

Field Name	Format	Description
NLD.EXTENED_POST_CODE	String	The 6-digit postal code. The output contains a candidate's 6-digit postal code if one is available.

Table 69: New Zealand (NZL) Country Specific Fields

Field Name	Format	Description
NZL.Aliased.SUBURB	String	The New Zealand aliased suburb. An alternative to the officially-recognized suburb name.

Table 70: United Kingdom (GBR) Country Specific Fields

Field Name	Format	Description
GBR.DependentStreet.Name	String	The addresses in the United Kingdom may contain two street names: a main street name and dependent street name. Some addresses may not contain a street name at all.
GBR.Dependent.Locality	String	The dependent locality name. A dependent locality is a large village or district. For example, Wimbledon .
GBR.DoubleDependent.Locality	String	The double dependent locality name. A double dependent locality is a small village or subdistrict.
GBR.Historic.Postcode	String	If the input address contained an old postal code that has been replaced by a new postal code, this field contains the old postal code.
GBR.Aliased.Locality	String	A locality that is not part of the postal address.
GBR.OSAPR	String	The Ordnance Survey Address Point reference (OSAPR). Each address has a unique OSAPR. OSAPRs are always 18 characters long and must start with the letters AP.
GBR.UPRN	String	The Unique Property Reference Number. The UPRN is a unique identifier that provides a persistent reference to a unique property, regardless of changes in the property name, status, subdivision, use (such as from single occupancy to multiple occupancy), or demolition of the property. All historic, alternative, and provisional addresses are recorded against the same UPRN. The UPRN field is not returned for Northern Ireland addresses.
GBR.RPC	String	The RPC identifies the positional accuracy of the candidate. The RPC describes the accuracy of the coordinates allocated to the address.

Table 71: United States (USA) Country Specific Fields

Field Name	Format	Description
USA.AbbreviatedCityName	String	The abbreviated city name.
USA.AddressLocation	String	The location where the address information was found. 01 Input address found on address line 1. 02 Input address found on address line 2. 03 Input address found on address lines 1 and 3. 04 Firm found on input address line 1. No address line found. 06 Input address found on address line 2. Firm found on address line 1. 08 Firm found on input address line 2. No address line found. 09 Input address found on address line 1. Firm found on address line 2. 80 Address line not found.
USA.AdvancedBarcode	String	The returned 14-digit barcode consisting of the beginning frame character, ZIP Code, ZIP + 4, delivery point, check digit, and end framing character.
USA.AltStreet	String	The returned alternate street name.
USA.AltStreetType	String	The returned alternate street name type. B Base street. A Alias (other). D Alternate street. P Preferred alias. X Abbreviated alias.
USA.Apartment1	String	The first apartment (unit) field in the address. This field is used for output. This field will only be populated if the Save unit in separate field is selected. If selected, the data is not included on the AddressLineX field(s).
USA.Apartment2	String	The second apartment (unit) field in the address. This field is used for output. This field will only be populated if the Save unit in separate field is selected. If selected, the data is not included on the AddressLineX field(s).

Field Name	Format	Description
USA.BCCheckDigit	String	The valid one-digit modulo check digit required for printing the correct barcode.
USA.CarrierRouteCode	String	The returned carrier route code.
USA.CASSAddressLine1	String	For successfully-coded addresses, the output label line Address Line 1 contains the coded address line information.
USA.CASSAddressLine2	String	For successfully-coded addresses, the output label line Address Line 2 contains the city/state/ZIP Code information.
USA.CASSCityName	String	The city name. The city name returned here is the city name mandated by USPS regulations. Variations of the city name (for example, full, abbreviated, and non-mailing) are returned in alternate fields.
USA.CongressionalDistrict	String	The returned congressional district.
USA.DefaultMatch	String	The returned default match. Y Carrier route, or ZIP + 4, or DPBC default values returned. Blank No default values returned.
USA.DPV	String	The returned Delivery Point Validation (DPV) indicators. N The address is not a valid delivery point. The USPS cannot deliver mail to this address. Y The address is delivery point validated. Primary range and secondary range (when present) are valid. The USPS can deliver mail to this address. S This address contains a valid primary range. Secondary range is present but is not confirmed. The USPS can deliver mail to this address. D This address contains a valid primary range. Secondary range is missing. The USPS can deliver mail to this address.

Field Name	Format	Description
USA.DPV.CMRA	String	The returned Commercial Mail Receiving Agents (CMRA) indicators.
		Y The address is a valid CMRA.
		N The address is a confirmed delivery point but is not a valid CMRA.
		Blank This field is blank if the address is not a confirmed delivery point.
USA.DPV.DNA	String	The DPV Door Not Accessible (DNA) Table status indicator. The DNA Table identifies delivery addresses where carriers cannot knock on the door for mail delivery or where carriers cannot physically access a residence/building such as rural/highway contact route (HCR), long driveway, or gated community.
		Y The address was found in the DPV DNA Table.
		N The address was not found in the DPV DNA Table.
		Blank The DPV DNA Table was not queried.
USA.DPV.FalsePositive	String	The DPV False Positive Flag.
		Y The address is not a confirmed delivery point and a positive response was received from the False Positive File.
		N The address is not a confirmed delivery point and a negative response is received from the False Positive File. This field is blank if the address is a confirmed delivery point.
		Blank The False/Positive Table was not queried.

Field Name	Format	Description
USA.DPV.Footnote	String	The returned DPV footnote code.
		A1 Input address did not match to the ZIP + 4 File.
		AA Input address matched to the ZIP + 4 File.
		BB Input address matched to DPV (all components).
		CC Input address primary number matched to DPV but secondary number did not match (present but invalid).
		F1 Input address matched to a military ZIP Code.
		G1 Input address matched to a General Delivery address.
		M1 Input address primary number missing.
		M3 Input address primary number is invalid.
		N1 Input address primary number matched to DPV but address is missing secondary number.
		P1 Input address missing PO Box, rural route, or highway contract number.
		P3 Input address PO Box, rural route, or highway contract number invalid.
		PB Input address is a PO Box Street Address (PBSA).
		R1 Input address matched to CMRA but secondary number is not present.
R7 Input address is a Carrier Route R777.		
RR Input address matched to CMRA.		
U1 Input address matched to a unique ZIP Code.		
USA.DPV.LeadingDirectional	String	The parsed street predirectional for the record creating the False Positive (Seed) Table violation.
USA.DPV.MatchedZIP	String	The parsed ZIP Code for the record creating the False Positive (Seed) Table violation.
USA.DPV.MatchedZIP4	String	The parsed Plus4 ZIP Code for the record creating the False Positive (Seed) Table violation.
USA.DPV.NoStat	String	The DPV No-Stat Table status.
		Y The address was found in the DPV No-Stat Table.
		N The address was not found in the DPV No-Stat Table.
		Blank The DPV No-Stat Table was not queried.

Field Name	Format	Description
USA.DPV.NSL	String	The DPV No Secure Location (NSL) Table status.
		Y The address was found in the in the DPV NSL Table.
		N The address was not found in the DPV NSL Table.
		Blank The DPV NSL Table was not queried.
USA.DPV.PBSAFound	String	The DPV PO Box Street Address (PBSA) Table status indicator.
		Y The address was found in the DPV PBSA Table.
		N The address was not found in the DPV PBSA Table.
		Blank The DPV PBSA Table was not queried.
USA.DPV.Range	String	The parsed street primary range for the record creating the False Positive (Seed) Table violation.
USA.DPV.SeedHit	String	The DPV False Positive (Seed) Table indicator.
		Y The address was found in the in the DPV False Positive (Seed) Table.
		N The address was not found in the DPV False Positive (Seed) Table.
USA.DPV.StreetName	String	The street name for the address creating the False Positive (Seed) Table violation.
USA.DPV.Suffix	String	The street suffix for the address creating the False Positive (Seed) Table violation.
USA.DPV.Throwback	String	The DPV P.O. Box Throwback Table indicator.
		Y The address was found in the in the DPV P.O. Box Throwback Table.
		N The address was not found in the DPV P.O. Box Throwback Table.
		Blank The DPV P.O. Box Throwback Table was not queried.
USA.DPV.TrailingDirectional	String	The street postdirectional for the address creating the False Positive (Seed) Table violation.
USA.DPV.UnitDesignator	String	The unit designator for the address creating the False Positive (Seed) Table violation.

Field Name	Format	Description
USA.DPV.UnitNumber	String	The unit number for the record creating the False Positive (Seed) Table violation.
USA.DPV.Vacant	String	The DPV Vacant Table indicator. Y The address was found in the DPV Vacant Table. N The address was not found in the DPV Vacant Table. Blank The DPV Vacant Table was not queried.
USA.DPV.ZIP4	String	The ZIP + 4 used for DPV processing.
USA.EWSFailure	String	The address was not matched because the address was found in the USPS Early Warning System (EWS) File.
USA.FIPSCountyNumber	String	The returned five-digit FIPS code. Positions 1 and 2 contain the state code. Positions 3 through 5 contain the county code. Used for output information only.
USA.FiveDigitBarcode	String	The returned five-digit barcode.
USA.FiveDigitScheme	String	The returned 5-digit combined ZIP Code.
USA.FullCityName	String	The full city name.
USA.LACS	String	The LACSLink status. L The address is eligible for LACSLink processing. Blank No LACSLink processing available.
USA.LACS.Indicator	String	The one-byte CASS Stage file LACS ^{Link} Indicator value. If you are not performing a CASS Stage test, this field can be ignored. If you are performing a CASS Stage test, use the value in this field to populate the stage record. Y Record found in the LACS ^{Link} False Positive (Seed) Table. N Record not found in the LACS ^{Link} False Positive (Seed) Table.
USA.LACS.PreLACSAddress	String	The input address before LACSLink processing.

Field Name	Format	Description
USA.LACS.PreLACSLeadingDirectional	String	The input address street predirectional determined before LACSLink processing.
USA.LACS.PreLACSMatchedZIP	String	The input address matched ZIP Code determined before LACSLink processing.
USA.LACS.PreLACSMatchedZIP4	String	The input address matched ZIP+4 Code determined before LACSLink processing.
USA.LACS.PreLACSRange	String	The input address street primary range determined before LACSLink processing.
USA.LACS.PreLACSStreetName	String	The input address street name determined before LACSLink processing.
USA.LACS.PreLACSSuffix	String	The input address street suffix determined before LACSLink processing.
USA.LACS.PreLACSTrailingDirectional	String	The input address street postdirectional determined before LACSLink processing.
USA.LACS.PreLACSUnitD	String	The input address unit designator determined before LACSLink processing.
USA.LACS.PreLACSUnitN	String	The input address unit number determined before LACSLink processing.
USA.LACS.ReturnCode	String	<p>The LACSLink return code.</p> <p>A LACS^{Link} processing successful. Record matched through LACS^{Link} processing.</p> <p>00 LACS^{Link} processing failed. No matching record found during LACS^{Link} processing.</p> <p>09 LACS^{Link} processing matched the input address to an older highrise default address. The address has been converted. However, rather than provide an imprecise address, LACS^{Link} processing does not provide a new address.</p> <p>14 LACS^{Link} processing failed. Match found during LACS^{Link} processing but conversion did not occur due to other USPS regulations.</p> <p>92 LACS^{Link} processing successful. Record matched through LACS^{Link} processing. Unit number dropped on input.</p>

Field Name	Format	Description
USA.LACS.SeedHit	String	Indicates if the address was found in the LACSLink False Positive (Seed) Table.
		Y The address was found in the LACS ^{Link} False Positive (Seed) Table.
		N The address was not found in the LACS ^{Link} False Positive (Seed) Table.
USA.LOTCode	String	The returned enhanced Line of Travel (eLOT) code. Used for output information only. If eLOT is unavailable, the default value is 0000D.
USA.LOTSequence	String	The last character of the eLOT code indicates eLOT sequence.
		A Ascending.
		D Descending.
USA.MatchLevel	String	The returned match level.
		F Firm record match.
		G General delivery match.
		H Highrise match.
		P PO Box match.
		R Rural route/highway contract match.
S Street level match.		
USA.NonMailingCityName	String	The non-mailing city name. A city name that is recognized by the USPS, but is not the preferred name for the ZIP Code. This is often a vanity name for the area.
USA.Parsed.AltPostDirectional	String	The parsed alternate post directional.
USA.Parsed.AltPreDirectional	String	The parsed alternate pre-directional.
USA.Parsed.AltRange	String	The parsed alternate range.
USA.Parsed.AltStreetName	String	The parsed alternate street name.
USA.Parsed.AltStreetSuffix	String	The parsed alternate suffix.
USA.Parsed.PMUnitDesignator	String	The parsed PMB or MSC designator.

Field Name	Format	Description
USA.Parsed.PMUnitNumber	String	The parsed PMB or MSC unit number.
USA.Parsed.PostDirectional	String	The parsed post-directional.
USA.Parsed.PreDirectional	String	The parsed pre-directional.
USA.Parsed.Range	String	The parsed primary range.
USA.Parsed.StreetName	String	The parsed street name.
USA.Parsed.StreetSuffix	String	The parsed street suffix.
USA.Parsed.Unit2Designator	String	The parsed second unit designator.
USA.Parsed.Unit2Number	String	The parsed second unit number.
USA.Parsed.UnitDesignator	String	The parsed unit designator.
USA.Parsed.UnitNumber	String	The parsed unit number.
USA.POBoxOnly	String	<p>The PO Box only delivery zone status indicator.</p> <p>Y The address ZIP Code is a PO Box only delivery zone.</p> <p>N The address ZIP Code is not a PO Box only delivery zone.</p> <p>Blank Unable to determine USPS ZIP Code for input address.</p>
USA.PostalBarcode	String	The returned delivery point barcode.

Field Name	Format	Description
USA.PreferredCityName	String	<p>The preferred city name for ZIP Code.</p> <p>Note: For successfully-coded addresses, the USA.PreferredCityName and the USA.PreferredState fields are always populated.</p> <p>For non-coded addresses, the USA.PreferredCityName and the USA.PreferredState fields are populated in the following scenarios:</p> <ul style="list-style-type: none"> • ZIP Code only input (city not input, or not found). • Single ZIP Code city input (ZIP Code not input, or not found). • City/St/ZIP Code input and agree (ZIP Code is part of city). <p>For all other non-coded scenarios, the preferred fields are blank.</p>
USA.PreferredState	String	<p>The preferred state abbreviation for the preferred city name.</p> <p>Note: For successfully-coded addresses, the USA.PreferredCityName and USA.PreferredState fields are always populated.</p> <p>For non-coded addresses, the USA.PreferredCityName and USA.PreferredState fields are populated in the following scenarios:</p> <ul style="list-style-type: none"> • ZIP Code only input (city not input, or not found). • Single ZIP Code city input (ZIP Code not input, or not found). • City/St/ZIP Code input and agree (ZIP Code is part of city). <p>For all other non-coded scenarios, the preferred fields are blank.</p>
USA.PrivateMailbox	String	The returned matched Private Mail Box (PMB) or Mail Stop Code (MSC).
USA.PrivateMailbox.Input	String	Reserved for future use.
USA.PrivateMailbox.Type	String	Reserved for future use.
USA.PrivateMailbox.Type.Input	String	Reserved for future use.
USA.RDI	String	<p>The returned Residential Delivery Indicator (RDI).</p> <p>Y The address is a residential delivery.</p> <p>N The address is a business delivery.</p> <p>Blank The address failed address lookup (did not return a ZIP+4), or RDI was not active.</p>

Field Name	Format	Description
USA.SeasonalFlags	String	<p>The seasonal delivery indicator beginning with January. The seasonal indicators for the returned ZIP Code. These indicators identify, at the 5-digit ZIP Code level, the months in which seasonal addresses receive delivery. There are 12 monthly flags (January through December). A "Y" in one of the monthly slots indicates that seasonal addresses are delivered mail in the month indicated by that slot. This field is blank if there are no seasonal deliveries for the ZIP Code.</p> <p>Y Deliver mail in this month.</p> <p>N Do not deliver mail in this month.</p>
USA.Status	String	<p>The match status of the address.</p> <p>F The address failed to match.</p> <p>Blank The address was successfully matched.</p>

Field Name	Format	Description
------------	--------	-------------

USA.Status.Code	String	
-----------------	--------	--

USA.Status.Description		
------------------------	--	--

Field Name	Format	Description
		The returned match status code.
	4101	No city, state, and ZIP Code in address.
	4102	No ZIP Code and no city name in address.
	4103	No ZIP Code and no state name in address.
	4104	Cannot match to Unique ZIP Code.
	4211	Invalid ZIP Code and no city name in address.
	4212	No ZIP Code and invalid city name in address.
	4213	Invalid ZIP Code and invalid city name in address.
	4301	No street name in input address.
	4399	Blank address record.
	4411	No primary street name found in the Global Address Validation database.
	4412	No primary names ranked with certainty.
	4421	Invalid range or house number.
	4422	Incorrect or missing directional.
	4423	Incorrect or missing suffix.
	4425	Incorrect or missing suffix and directional.
	4450	No range in input address.
	4451	Multiple component failure. An address component had multiple options causing the address to fail assignment.
	4460	EWS Failure. Address found on EWS table.
	4461	eLOT assignment has failed. Address coded successfully but eLOT code not assigned.
	4465	The address requires a firm. No firm was provided or the firm failed to match.
	4466	The address requires secondary addresses (there is no default street address). No secondary was provided or the secondary did not match.
	4467	The address coded but was flagged for ZIP Move processing. The address failed to meet the final ZIP Move criteria. ZIP Move processing requires an exact match of street, suffix, and directional (both pre and post).
	4500	Unable to code. If reason for inability to code cannot be determined, this error is issued.
	4600	Undeliverable address in the Global Address Validation database.

Field Name	Format	Description
		<p>Note: This status code can still be valid with a successfully matched address. The combination of the two codes indicates that this is a valid address but is not deliverable by USPS standards.</p>
		<p>4601 The address failed Delivery Point Validation (DPV) processing.</p>
		<p>4602 The address is flagged as Carrier Route R777 and is not eligible for street delivery. This status code is only generated if the option R777 Deliverable is not activated.</p>
		<p>4801 Address is locked and was not be processed.</p>
		<p>5101 Warning: Missing apt/suite number.</p>
		<p>5102 Warning: Apt/suite was input but is not valid.</p>
		<p>5103 Warning: Input firm name is missing or invalid.</p>
		<p>5104 Warning: Multiple firms returned for address.</p>
		<p>5105 Warning: PO Box number is invalid or unavailable.</p>
		<p>5106 Warning: Apt/Suite was input but not allowed for this address.</p>
		<p>5200 Information: Address bypassed counted correct in Process Unassign run.</p>
USA.StreetNameAliasType	String	<p>The type of alias street name. An alias street name is an alternate name for a street, maintained at the 5-digit ZIP Code level.</p> <p>Abbreviated The alias street name is an abbreviation of the street name. For example, HARTS-NM RD is an abbreviated alias for HARTSVILLE NEW MARLBORO RD.</p> <p>Changed The official street name changed and the alias street name reflects the new official street name. For example, if SHINGLE BROOK RD is changed to CANNING DR, then CANNING DR would be a changed alias type.</p> <p>Other The alias street name is made up of nicknames, other names, or common abbreviations for the street name.</p> <p>Preferred The alias street name is the USPS preferred alias street name.</p>

Field Name	Format	Description
USA.SuiteLink.Fidelity	String	The SuiteLink fidelity code.
		1 All words in the business name match.
		2 Acceptable match. One or more words in the business name did not match, but acceptance criteria was still met.
		3 Unacceptable match. One or more words in the business name did not match. Acceptance criteria was not met.
USA.SuiteLink.MatchCode	String	The SuiteLink match code.
		A SuiteLink match found.
		B No SuiteLink match found.
		C Business name normalized to a blank value.
		D ZIP + 4 Code not recognized as a high-rise default.
		E Suite ^{Link} database expired.
USA.SuiteLink.ReturnCode	String	The SuiteLink return code.
		A Successful SuiteLink match.
		00 Failed SuiteLink match.
USA.VeriMoveDataBlock	String	Reserved for future use.
USA.ZIPValid	String	The returned ZIP Code.
USA.ZIP4Valid	String	The returned ZIP + 4 Code.

Global Type Ahead

Global Type Ahead automatically suggests addresses as you type and immediately returns candidates based on your input. You can then select your candidate from the presented candidate list. Global Type Ahead is part of the Global Addressing Module.

Supported Countries

Global Type Ahead covers street addresses and Points of Interest (POI) for the following countries. The three-digit ISO country code is shown for each country. For a complete list of all ISO country codes, see [ISO Country Codes and Coder Support](#).

Note: The POI data must be purchased separately. POI and category/subcategory features are accessible only if available and you have licensed and installed POI data. Street address data is packaged with the Global Addressing Module.

- Andorra (AND)
- Australia (AUS)
- Austria (AUT)
- Bahrain (BHR)
- Belgium (BEL)
- Brazil (BRA)
- Canada (CAN)
- Czech Republic (CZE)
- Denmark (DNK)
- Finland (FIN)
- France (FRA)
- Germany (DEU)
- Greece (GRC) (Does not include POI information)
- Hungary (HUN)
- Ireland (IRL)
- Italy (ITA)
- Japan (JPN)
- Kuwait (KWT)
- Liechtenstein (LIE)
- Luxembourg (LUX)
- Mexico (MEX)
- Netherlands (NLD)
- New Zealand (NZL) (Does not include POI information)
- Norway (NOR)
- Oman (OMN)
- Poland (POL)
- Portugal (PRT)
- Qatar (QAT)
- Russia (RUS)
- Saudi Arabia (SAU)
- Singapore (SGP)
- Slovakia (SVK)
- Slovenia (SVN)
- South Africa (ZAF)
- Spain (ESP)
- Sweden (SWE)
- Switzerland (CHE)

- Thailand (THA)
- Turkey (TUR)
- United Arab Emirates (ARE)
- United Kingdom (GBR)
- United States (USA)

Note: See the current Database Release Notes for more details of country coverage and data vintages.

Options

Global Type Ahead uses the default options settings to define address retrieval processing.

Table 72: Global Type Ahead Options

Option Name	Country Support	Description
Database	All	The database to use for Global Type Ahead processing. Only databases that have been defined in the Database Resources panel in the Management Console are available.
Default Country	All	The default country for address match processing.
Search type	All	The Global Type Ahead search options: <ul style="list-style-type: none"> Address Search for street addresses. Point Of Interest Search for Points of Interest (POI). City Search for street addresses within a specific city. State Search for street addresses within a specific state. Postal Search for street addresses within a specific postal code.
Max candidates	All	The maximum number of search candidates returned. The maximum is 99. The default is 5.

Option Name	Country Support	Description
Fuzzy match	All	Global Type Ahead implements algorithms that optimize the retrieval of addresses and POIs, even when the input spelling is incorrect or incomplete. These capabilities are referred to as Fuzzy Match, and are implemented through match setting constraints. None Fuzzy Match is disabled by default. Hard Match The hard match allows one character substitution, insertion, deletion, or transposition. Soft Match The soft match allows two character substitutions, insertions, deletions, or transpositions.
Match on address number	All	You can specify Match on address number to determine if a house number match is required to get a match. If this match restriction is checked, then returned candidates must match the input house number. By default, the Match on address number box is unchecked, which means that returned candidates do not have to match the input house number. If the input does not contain a house number, the Match on address number restriction has no effect.

Input

In an interactive environment, Global Type Ahead automatically suggests addresses as you type and immediately returns candidates based on your input. Global Type Ahead can also return Points of Interest (POI).

Note: The POI data must be purchased separately. POI and category/subcategory features are available only if you have licensed and installed POI data. Street address data is packaged with the Global Addressing Module.

Table 73: Global Type Ahead Input

Field Name	Format	Description
AddressLine1	String	The complete first line of the address, typically including street and house number.
City	String	The city or town name.
StateProvince	String	The name of one of the state or province depending on the country.

Field Name	Format	Description
PostCode	String	The postal code for the address. The format of the postal code varies by country.
Country	String	The country name or the two or three-character ISO country code. If you omit the country, Global Type Ahead returns the best available candidates for the Default Country selected on the Default Options tab. For a list of ISO codes, see ISO Country Codes and Coder Support .

Output

Global Type Ahead output is determined by the output options you selected.

Returned candidates can be previewed in the Management Console. Candidates include the complete address elements that you expect to see in Spectrum™ Technology Platform candidates, such as AddressLine, Range, City, County, State, and Country.

Note: The Global Type Ahead stage currently supports Range and Range Units for the United Kingdom (GBR) and the United States (USA). For the United Kingdom (GBR), UK Royal Mail (RM) data is used. For the United States (USA), Master Location Data (MLD) is used.

Table 74: Global Type Ahead Output

Field Name	Format	Description
AddressLine1	String	The complete first line of the address, typically including street and house number.
AddressNumber.Match	String	The status of the match attempt on address number. Returns true to indicate that the input address number matched the candidate. If address number is not matched, this field is not returned.
City	String	The city or town name.
City.Match	String	The status of the match attempt on city. Returns true to indicate that the input city matched the candidate. If city is not matched, this field is not returned.
County	String	The county name.
Country	String	The country name.
FirmName	String	The name of a company.

Field Name	Format	Description
FormattedAddress	String	The formatted address.
LastLine	String	The last line of the address. For example, 10 DOWNING STREET LONDON, SW1A 2AA.
Locality	String	The locality.
PostalCode	String	The postal code for the address. The format of the postal code varies by country.
RangeCount	String	The number of ranges for the candidate.
Ranges	String	Additional information for each range identified for the candidate. <ul style="list-style-type: none"> • Range—The range number. • UnitCount—The number of units for the range. • UnitsInfo—Provides information for the unit and the formatted unit address.
StateProvince	String	The name of one of the state or province depending on the country.
StreetName.Match	String	The status of the match attempt on street name. Returns true to indicate that the input street name matched the candidate. If street name is not matched, this field is not returned.
Type	String	Returns 1 for a POI match. Returns 2 for a street address match. POI and category/subcategory features are available only if you have licensed and installed POI data. You must have a license for POI data to include it and be able to return candidates for the dictionary.

Universal Addressing Module

Universal Addressing Module

The Universal Addressing Module is an address quality module that can standardize and validate addresses, improving the deliverability of mail. The Universal Addressing Module can ensure that your address data adheres to quality standards established by the postal authority. An address that

adheres to these standards is more likely to be delivered in a timely manner. In addition, mailers who follow these standards can qualify for significant postage discounts. For information on discounts for U.S. mail, refer to the USPS *Domestic Mail Manual (DMM)* available at <https://postalpro.usps.com/>. For information on discounts for Canadian mail, refer to the Canada Post website at www.canadapost.ca. For information on discounts for Australian mail, refer to the Australia Post website at www.auspost.com.au.

You can use the Universal Addressing Module in batch mode, real-time mode, or as a hosted service, depending on which option you have licensed. The batch version of the Universal Addressing Module is CASS Certified™ by the USPS®.

Components

The Universal Addressing Module consists of the following components. These components can work with U.S., Canadian, Australian, and international addresses as long as you have licensed the appropriate database (if you are running Universal Addressing in your environment) or hosted service (if you are using Universal Addressing through the Pitney Bowes hosted services).

- **Auto Complete Loqate**— Offers real-time entry of address data and returns instant results based on each character entered into the form, ensuring only accurate data is entered into the database.
- **Get Candidate Addresses**— Returns a list of possible matches for a given address.
- **Get Candidate Addresses Loqate**— Returns a list of possible matches for a given address using a Loqate engine and database.
- **Get City State Province**— Returns the city and state or province for a given postal code.
- **Get City State Province Loqate**— Returns the city and state or province for a given postal code using a Loqate engine and database.
- **Get Postal Codes**— Returns the postal codes for a given city.
- **Get Postal Codes Loqate**—Returns the postal codes for a given city using a Loqate engine and database.
- **Validate Address**—Standardizes and validates addresses using U.S., Canadian, and international postal data.
- **Validate Address Global**— Provides enhanced address standardization and validation for addresses outside the U.S. and Canada. Validate Address Global can also validate addresses in the U.S. and Canada, but its strength is in validating addresses in other countries. If you process a significant number of addresses outside the U.S. and Canada, consider using Validate Address Global.
- **Validate Address Loqate**— Standardizes and validates addresses using postal authority address data. Validate Address Loqate can correct information and format addresses using the format preferred by an applicable postal authority. It also adds missing postal information, such as postal codes, city names, and state or province names.

Addressing Databases

The Universal Addressing Module uses a number of required and optional databases. The databases are installed on the Spectrum™ Technology Platform server. Some of the databases are available

by subscription from Pitney Bowes and are updated monthly or quarterly. Others are licensed from the USPS®. The following table lists the Universal Addressing databases.

Table 75: Universal Addressing Module Databases

Database Name & Description	Required or Optional	Supplier
<p>U.S. Postal Database</p> <p>The U.S. Postal Database is in a Pitney Bowes proprietary format. It contains every house number range in the United States and is updated on a monthly basis. The database files contain the following information:</p> <ul style="list-style-type: none"> • ZIP + 4® Code • Standardized address elements • City and state information <p>The U.S. Postal Database also contains the data needed to perform Enhanced Street Matching (ESM) and All Street Matching (ASM). ESM and ASM apply extra matching logic to any input address that is not matched through the regular address validation process.</p>	Required for U.S. address processing	Pitney Bowes monthly subscription
<p>Canadian Postal Database</p> <p>The Canadian Postal database is in Pitney Bowes proprietary format. The database files contain the following information:</p> <ul style="list-style-type: none"> • Postal code • Standardized address elements • Municipality and province information 	Required for Canadian address processing	Pitney Bowes monthly subscription
<p>Australia Post Postal Address File Database</p> <p>The Postal Address File is part of Australia Post's Address Matching Approval System (AMAS) program. The database file contains the following information:</p> <ul style="list-style-type: none"> • Postal code • Standardized address elements 	Required for Australian address processing	Pitney Bowes monthly subscription

Database Name & Description	Required or Optional	Supplier
<p>International Postal Database</p> <p>The International Postal Database is a collection of postal address data from around the world. Data from each country is categorized according to the level of data available. The categories are:</p> <ul style="list-style-type: none"> • Category A—Enables the validation and correction of an address's postal code, city name, state/county name, street address elements, and country name. • Category B—Enables the validation and correction of an address's postal code, city name, state/county name, and country name. It does not support the validation or correction of street address elements. • Category C—Enables the validation and correction of the country name, and the validation of the format of the postal code. 	Required for International address processing	Pitney Bowes quarterly subscription
<p>DPV® Database</p> <p>The Delivery Point Validation database allows you to check the validity of an individual mailing address in the U.S. The DPV database enhances the U.S. Postal database's ability to validate mailing addresses.</p> <p>Note: The DPV database also contains the data required for Commercial Mail Receiving Agency (CMRA) processing.</p> <p>Each time an edition of the U.S. Postal database is released, a corresponding edition of the DPV database is released. Although USPS licensing allows the use of the U.S. Postal database beyond the expiration date (with certain restrictions), DPV lookups may not be performed after the expiration date of the DPV database.</p> <p>USPS licensing prohibits using DPV data for the generation of addresses or address lists. To prevent the generation of address lists, the DPV database contains "false positive records." False positive records are artificially manufactured addresses. For each negative response that occurs in a DPV query, a query is made to the False/Positive table in the DPV database. A match to this table will stop DPV processing.</p> <p>USPS licensing also prohibits exporting the DPV data outside the United States.</p>	Optional, but required for CASS Certified™ processing; U.S. addresses only	Pitney Bowes monthly subscription

Database Name & Description	Required or Optional	Supplier
<p>eLOT® Database</p> <p>The Enhanced Line of Travel (eLOT) database is a U.S. address database that ensures that Enhanced Carrier Route mailings are sorted as close as possible to the actual delivery sequence. the eLOT database is required for certain types of postal discounts.</p> <p>You will receive monthly updates to your eLOT database on the same media as the U.S. Postal database.</p> <p>You must install the U.S. Postal database and eLOT database from the same month (for example, September eLOT data must be processed with a September U.S. Postal database). If the U.S. Postal database and the eLOT database are not from the same month, there may be ZIP + 4® Codes for which eLOT numbers cannot be assigned. The ZIP Code™, ZIP + 4 Code, carrier route code, and the delivery point of an address must be provided to assign a eLOT code.</p>	Optional; U.S. addresses only	Pitney Bowes monthly subscription
<p>EWS Database</p> <p>The Early Warning System (EWS) database prevents address validation errors that can result due to a delay in postal data reaching the U.S. Postal database.</p> <p>The EWS database consists of partial address information limited to the ZIP Code™, street name, pre- and post-directionals, and a suffix. For an address record to be EWS-eligible, it must be an address not present on the most recent monthly production U.S. Postal database.</p> <p>The USPS® refreshes the EWS file on a weekly basis (Thursdays). You can download the EWS file from the USPS® website at https://postalpro.usps.com/.</p>	Optional; U.S. addresses only	Download for free from USPS® website
<p>LACSLink® Database</p> <p>The LACSLink database allows you to correct addresses that have changed as a result of a rural route address converting to street-style address, a PO Box renumbering, or a street-style address changing.</p> <p>USPS licensing prohibits using LACSLink for the generation of addresses or address lists. To prevent the generation of address lists, the LACSLink database contains "false positive records." False positive records are artificially manufactured addresses. For each negative response that occurs in a LACSLink query, a query is made to the False/Positive table in the LACSLink database. A match to this table will stop LACSLink processing.</p> <p>USPS licensing also prohibits exporting the LACSLink database outside the United States</p>	Optional, but required for CASS Certified™ processing; U.S. addresses only	Pitney Bowes monthly subscription

Database Name & Description	Required or Optional	Supplier
<p>RDI™ Database</p> <p>The Residential Delivery Indicator (RDI™) file processing determines whether an address is a residential, business, or mixed (residential and/or business) address.</p> <p>RDI is similar to DPV. In RDI, data is supplied as hash tables. However, RDI is a much simpler process than DPV. In DPV, the standard hash algorithm is determined only for the 9-digit and 11-digit ZIP Code™ rather than the entire address.</p>	Optional; U.S. addresses only	Pitney Bowes monthly subscription
<p>Suite^{Link™} Database</p> <p>Suite^{Link™} corrects secondary address information for U.S. business addresses whose secondary address information could not be validated. If Suite^{Link} processing is enabled, ValidateAddress attempts to match the value in the FirmName field to a database of known firm names. ValidateAddress then supplies the correct secondary address information.</p>	Optional; U.S. addresses only	Pitney Bowes monthly subscription

AutoCompleteLoqate

AutoCompleteLoqate offers real-time entry of address data for fast, accurate results. Users are returned instant results based on each character entered into the form, ensuring only accurate data is entered into the database. AutoCompleteLoqate also includes the Powersearch option, which reduces input time by up to 80% for 238 countries by using data in the form of an index file.

Input

The following table lists the input for AutoCompleteLoqate.

Table 76: Input Format

columnName	Description
AddressLine1	The first address line.
AddressLine2	The second address line.

columnName	Description
AddressLine3	The third address line.
AddressLine4	The fourth address line.
City	The city name.
Country	<p>The country code or name, in any of the following formats:</p> <ul style="list-style-type: none"> • 2-digit ISO country code • 3-digit UPU Country code • English country name <p>For a list of ISO codes, see ISO Country Codes and Module Support on page 788.</p>
FirmName	The company or firm name.
PostalCode	The postal code for the address.
StateProvince	The state or province.

Options

Table 77: AutoCompleteLoqate Options

optionName	Description
Database.Loqate	Specifies the database to be used for address processing. Only databases that have been defined in the Database Resources panel in the Management Console are available.

optionName	Description
OutputCasing	<p>Specifies the casing of the output data. One of the following:</p> <p>M Returns the output in mixed case (default). For example:</p> <p>123 Main St Mytown FL 12345</p> <p>U Returns the output in upper case. For example:</p> <p>123 MAIN ST MYTOWN FL 12345</p>
HomeCountry	<p>Specifies the default country. You should specify the country where most of your addresses reside. For example, if most of the addresses you process are in Germany, specify Germany. The valid country names are:</p> <p>Afghanistan, Albania, Algeria, American Somoa, Andorra, Angola, Anguilla, Antigua And Barbuda, Argentina, Armenia, Aruba, Australia, Austria, Azerbaijan, Bahamas, Bahrain, Bangladesh, Barbados, Belarus, Belgium, Belize, Benin, Bermuda, Bhutan, Bolivia, Bosnia And Herzegovina, Botswana, Brazil, British Virgin Islands, Brunei Darussalam, Bulgaria, Burkina Faso, Burundi, Cambodia, Cameroon, Canada, Cape Verde, Cayman Islands, Central African Republic, Chad, Chile, China, Colombia, Comoros Islands, Congo, Cook Islands, Costa Rica, Cote D'Ivoire, Croatia, Cuba, Cyprus, Czech Republic, Democratic Republic Of Congo, Denmark, Djibouti, Dominica, Dominican Republic, East Timor, Ecuador, Egypt, El Salvador, Equitorial Guinea, Eritrea, Estonia, Ethiopia, Falkland Islands, Faroe Islands, Federated States Of Micronesia, Fiji, Finland, France, French Guiana, Gabon, Gambia, Germany, Ghana, Gibraltar, Greece, Greenland, Grenada, Guadeloupe, Guam, Guatemala, Guinea, Guinea Bissau, Guyana, Haiti, Holy See, Honduras, Hong Kong, Hungary, Iceland, India, Indonesia, Iran, Iraq, Ireland, Israel, Italy, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Kiribati, Korea, Kuwait, Kyrgyzstan, Laos, Latvia, Lebanon, Lesotho, Liberia, Libya, Liechtenstein, Lithuania, Luxembourg, Macau, Macedonia, Madagascar, Malawi, Malaysia, Maldives, Mali, Malta, Marshall Islands, Martinique, Mauritania, Mauritius, Mayotte, Mexico, Moldova, Monaco, Mongolia, Monserrat, Morocco, Mozambique, Myanmar, Namibia, Nauru, Nepal, Netherlands Antilles, New Caledonia, New Zealand, Nicaragua, Niger, Nigeria, Niue, Norway, Oman, Pakistan, Palau, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Pitcairn Islands, Poland, Portugal, Puerto Rico, Qatar, Republic Of Georgia, Republic Of Korea, Republic Of Singapore, Reunion, Romania, Russia, Rwanda, Saint Helena, Saint Kitts And Nevis, Saint Lucia, Saint Pierre And Miquelon, Saint Vincent and the Grenadines, Samoa, San Marino, Sao Tome and Principe, Saudi Arabia, Senegal, Seychelles, Sierra Leone, Slovakia, Slovenia, Solomon Islands, Somalia, South Africa, Spain, Sri Lanka, Sudan, Surivalue, Swaziland, Sweden, Switzerland, Syria, Tahiti, Taiwan, Tajikistan, Tanzania, Thailand, The Netherlands, Togo, Tonga, Trinidad And Tobago, Tristan Da Cunha, Tunisia, Turkey, Turkmenistan, Turks And Caicos Islands, Tuvalu, Uganda, Ukraine, United Arab Emirates, United Kingdom, United States, Uruguay, Uzbekistan, Vanuatu, Venezuela, Vietnam, Virgin Islands (US), Wallis And Futuna, Yemen, Yugoslavia, Zambia, Zimbabwe</p>

optionName	Description
OutputCountryFormat	<p>Specifies the format to use for the country name returned in the Country output field. For example, if you select English, the country name "Deutschland" would be returned as "Germany".</p> <p>E Use English country names (default).</p> <p>I Use two-letter ISO abbreviation for the countries instead of country names.</p> <p>U Use Universal Postal Union abbreviation for the countries instead of country names.</p>
OutputScript	<p>Specifies the alphabet or script in which the output should be returned. This option is bi-directional and generally takes place from Native to Latin and Latin to Native.</p> <p>Input Do not perform transliteration and provide output in the same script as the input (default).</p> <p>Native Output in the native script for the selected country wherever possible.</p> <p>Latn Use English values.</p>
MaximumResults	<p>The maximum number of addresses that AutoCompleteLoqate should return. The default is 10.</p>
isPowersearchEnable	<p>Reduces input time by up to 80% for 240 countries by using data in the form of an index file. When you conduct a search, the Loqate Engine will first look for the corresponding index. If present, the method will attempt to instantly return a list of candidate addresses. If the index is not present, or if the index does not return any results, the original search process will be triggered.</p> <p>Note: Powersearch can be performed when there are two and only two fields in the input file: the Country field and any one of the AddressLine fields. If you select this option and your input file contains additional fields, the original search process will automatically be triggered.</p> <p>To conduct its search, Auto Complete indexes use up to the first 10 characters for searches within the United States and up to the first 15 characters for searches within all other eligible countries. Spaces and punctuation are not factored into this count.</p> <p>Powersearch cannot be used for the following countries: Botswana, Ethiopia, India, Kazakhstan, Malaysia, Mongolia, Saint Kitts and Nevis, and San Marino.</p> <p>Note: You must have a valid license for Powersearch processing. If you select this option but are not licensed for Powersearch, or if your license has expired, you will receive an error.</p>

optionName	Description
IsDuplicateHandlingMaskEnable	<p>Enables the duplicate handling mask and specifies how duplicate records are processed and removed. Select one or more of the following options:</p> <p>S Selected by default. Pre-process the input and remove duplicates that occur in a single field.</p> <p>C Selected by default. Pre-process the input and remove duplicates across all fields.</p> <p>T Pre-process the input and remove duplicates in fields that are not standard address fields.</p> <p>F Selected by default. Post-process the output from verification and remove duplicates from non-verified fields.</p>
FailJobOnDataLicenseError	<p>Specifies how you want Spectrum Technology Platform to respond when a data license error occurs.</p> <p>Fail the job Fail the entire job if a data license error occurs.</p> <p>Fail the record Fail the record(s) for which the data license error occurs and continue processing.</p>

Output

The output from AutoCompleteLoqate is optional and corresponds directly to the fields you selected in the Output Fields section of the AutoCompleteLoqate Options dialog box.

Table 78: AutoCompleteLoqate Output

columnName	Description
AddressLine1	The first address line.
AddressLine2	The second address line.
AddressLine3	The third address line.
AddressLine4	The fourth address line.

columnName	Description
City	The city name.
Country	The three-character ISO 3166-1 Alpha 3 code for the country. For a list of ISO codes, see ISO Country Codes and Module Support on page 788.
FirmName	The firm name.
HouseNumber	The ending house number for the range in which the candidate address's house number falls.
PostalCode	The postal code.
PostalCode.AddOn	The last four digits of the ZIP + 4 [®] Code.
ProcessedBy	Indicates which address coder processed the address. LOQATE The Loqate coder processed the address.
StateProvince	The state or province abbreviation.
Status	Reports the success or failure of the match attempt. null Success F Failure
Status.Code	The reason for failure, if there is one. <ul style="list-style-type: none"> • DisabledCoder • RequestFailed • NoLookupAddressFound

columnName	Description
Status.Description	A description of the problem, if there is one.
	<p>Did not return multiples The input address matched only one address in the database. AutoCompleteLoqate returns data only if multiple possible matches were found.</p> <p>Not able to look up the address pattern AutoCompleteLoqate is not able to process the partial address.</p>

GetCandidateAddresses

GetCandidateAddresses returns a list of addresses that are considered matches for a given input address. GetCandidateAddresses returns candidate addresses only if the input address matches multiple addresses in the postal database. If the input address matches only one address in the postal database, then no address data is returned.

For addresses outside the U.S. and Canada, you may notice inconsistent results between the multiple matches returned by ValidateAddress and the results for that same address returned by GetCandidateAddresses. If you experience inconsistent results, it is likely because you set the performance tuning setting in ValidateAddress to a value other than 100. To obtain consistent results between GetCandidateAddresses and ValidateAddress, set the performance tuning option to 100.

Note: By default, GetCandidateAddresses does not match to individual house numbers. Rather, it uses house number ranges for each street. After GetCandidateAddresses has determined the street name, city name, state/province name, and postal code, it checks to make sure the input house number falls within one of the ranges of house numbers given for the matched street name. The same type of logic applies to unit numbers. If you want to determine that an individual house number is valid, you should use the ValidateAddress Delivery Point Validation (DPV) processing option. DPV processing is only available for U.S. addresses.

The Canadian coder contains a reverse lookup routine that takes as input a specific postal code and returns the street information stored in the database for that postal code. To use this function enter nothing but a Canadian postal code in the PostalCode field. See the second example to view the return from a sample postal code.

GetCandidateAddresses is part of the Universal Addressing Module.

Input

The following table lists the input for GetCandidateAddresses.

Table 79: Input Format

columnName	Description
AddressLine1	The first address line.
AddressLine2	The second address line.
AddressLine3	The third address line. Does not apply to U.S. and Canadian addresses.
AddressLine4	The fourth address line. Does not apply to U.S. and Canadian addresses.
AddressLine5	The fifth address line. Applies only to U.K. addresses. May contain street name, unit number, building number, and so on.
City	The city name.
StateProvince	The state or province. For U.S. addresses only, you may put the state in the City field instead of the StateProvince field.
PostalCode	The postal code for the address. For U.S. addresses this is the ZIP Code™ in one of the following formats: 99999 99999-9999 A9A9A9 A9A 9A9 9999 999 Note: For Canadian addresses you can complete just this field and have candidate address data returned. For other countries, AddressLine1 and AddressLine2 must also be completed.

columnName	Description
Country	<p>The country code or name, in any of the following formats:</p> <ul style="list-style-type: none"> • 2-digit ISO country code • 3-digit UPU Country code • English country name • French country name • German country name • Spanish country name <p>For a list of ISO codes, see ISO Country Codes and Module Support on page 788.</p>
FirmName	The company or firm name.
USUrbanName	U.S. address urbanization name. Used primarily for Puerto Rico addresses.

Options

Table 80: GetCandidateAddresses Options

optionName	Description
PerformUSProcessing	<p>Specifies whether or not to process U.S. addresses. If you enable U.S. address processing GetCandidateAddresses will attempt to retrieve candidate addresses for U.S. addresses. If you disable U.S. address processing, U.S. addresses will fail, meaning they are returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for U.S. address processing you must disable U.S. address processing in order for your jobs to complete successfully, regardless of whether or not they contain U.S. addresses.</p> <p>Note: You must have a valid license for U.S. address processing to successfully process U.S. addresses. If you enable U.S. address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p>Y Yes, process U.S. addresses (default).</p> <p>N No, do not process U.S. addresses.</p>

optionName	Description
Database.US	Specifies the database to be used for U.S. address processing. Only databases that have been defined in the US Database Resources panel in the Management Console are available.
PerformCanadianProcessing	<p>Specifies whether or not to process Canadian addresses. If you enable Canadian address processing GetCandidateAddresses will attempt to retrieve candidate addresses for Canadian addresses. If you disable Canadian address processing, Canadian addresses will fail, meaning they are returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for Canadian address processing you must disable Canadian address processing in order for your jobs to complete successfully, regardless of whether or not they contain Canadian addresses.</p> <p>Note: You must have a valid license for Canadian address processing to successfully process Canadian addresses. If you enable Canadian address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p>Y Yes, process Canadian addresses (default).</p> <p>N No, do not process Canadian addresses.</p>
Database.Canada	Specifies the database to be used for Canadian address processing. Only databases that have been defined in the Canadian Database Resources panel in the Management Console are available.

optionName	Description
PerformInternationalProcessing	<p>Specifies whether or not to process international addresses (addresses outside the U.S. and Canada). If you enable international address processing GetCandidateAddresses will attempt to retrieve candidate addresses for international addresses. If you disable international address processing, international addresses will fail, meaning they are returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for international address processing you must disable international address processing in order for your jobs to complete successfully, regardless of whether or not they contain international addresses.</p> <p>Note: You must have a valid license for international address processing to successfully process international addresses. If you enable international address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p>Y Yes, process international addresses (default).</p> <p>N No, do not process international addresses.</p>
Database.International	<p>Specifies the database to be used for international address processing. Only databases that have been defined in the International Database Resources panel in the Management Console are available.</p>
OutputCasing	<p>Specifies the casing of the output data. One of the following:</p> <p>M Returns the output in mixed case (default). For example:</p> <p style="padding-left: 40px;">123 Main St Mytown FL 12345</p> <p>U Returns the output in upper case. For example:</p> <p style="padding-left: 40px;">123 MAIN ST MYTOWN FL 12345</p>
MaximumResults	<p>The maximum number of candidate addresses that GetCandidateAddresses should return. The default is 10. The maximum is 10.</p>

optionName	Description
OutputShortCityName	<p>For U.S. addresses, specifies whether or not to return the USPS®-approved abbreviation for the city, if there is one. The USPS® provides abbreviations for city names that are 14 characters long or longer. City abbreviations are 13 characters or less and can be used when there is limited space on the mailing label. If there is no short city name for the city, then the full city name is returned.</p> <p>Y Yes, return the short city name.</p> <p>N No, do not return the short city name.</p>
DualAddressLogic	<p>(U.S. addresses only). Controls whether GetCandidateAddresses should return a street match or a PO Box/Rural Route/Highway Contract match when the address contains both street and PO Box/Rural Route/Highway Contract information. For more information, see About Dual Address Logic on page 632.</p> <p>N (Default) USPS® CASS™ regulations determine the address returned based on the following order of priority:</p> <ol style="list-style-type: none"> 1. PO Box 2. Firm 3. Highrise 4. Street 5. Rural Route 6. General Delivery <p>S Return a street match, regardless of the address line.</p> <p>P Return a PO Box match, regardless of the address line.</p>
StreetMatchingStrictness	<p>The strictness of the street name match (U.S. addresses only).</p> <p>E The input street name must match the database exactly.</p> <p>T The matching algorithm is "tight."</p> <p>M The matching algorithm is "medium" (default).</p> <p>L The matching algorithm is "loose."</p>
FirmMatchingStrictness	<p>The strictness of the firm name match (U.S. addresses only).</p> <p>E The input firm name must match the database exactly.</p> <p>T The matching algorithm is "tight."</p> <p>M The matching algorithm is "medium" (default).</p> <p>L The matching algorithm is "loose."</p>

optionName	Description
DirectionalMatchingStrictness	<p>The strictness of the directional match.</p> <p>E The input directional must match the database exactly.</p> <p>T The matching algorithm is "tight."</p> <p>M The matching algorithm is "medium" (default).</p> <p>L The matching algorithm is "loose."</p>
PerformESM	<p>Specifies whether or not to perform Enhanced Street Matching (ESM). ESM applies extra matching logic with additional data to any input address that is not matched through the regular address validation process. ESM applies to U.S. addresses only.</p> <p>Y Yes, perform ESM processing.</p> <p>N No, do not perform ESM processing (default).</p>
AddressLineSearchOnFail	<p>Specifies whether ValidateAddress will search address lines for the city, state/province, and postal code.</p> <p>This option enables ValidateAddress to search the AddressLine input fields for the city, state/province, postal code, and country when the address cannot be matched using the values in the City, StateProvince, and PostalCode input fields.</p> <p>Consider enabling this option if your input addresses have the city, state/province, and postal code information in the AddressLine fields.</p> <p>Consider disabling this option if your input addresses use the City, State/Province and PostalCode fields. If you enable this option and these fields are used, there is an increased possibility that ValidateAddress will fail to correct values in these fields (for example a misspelled city name).</p> <p>Y Yes, search the address line fields (default).</p> <p>N No, do not search the AddressLine fields.</p>

Output

GetCandidateAddresses returns the following output.

Table 81: GetCandidateAddresses Output

columnName	Description
AddressLine1	The first address line.
AddressLine2	The second address line.
AddressLine3	The third address line.
AddressLine4	The fourth address line.
AddressLine5	For U.K. addresses only. If the address was validated, the fifth line of the validated and standardized address. If the address could not be validated, the fifth line of the input address without any changes.
CanadianDeliveryInstallation AreaName	Delivery installation name (Canadian addresses only)
CanadianDeliveryInstallation QualifierName	Delivery installation qualifier (Canadian addresses only)
CanadianDeliveryInstallation Type	Delivery installation type (Canadian addresses only)
City	The city name.
Country	The three-character ISO 3166-1 Alpha 3 code for the country. For a list of ISO codes, see ISO Country Codes and Module Support on page 788.
FirmName	The firm name.

columnName	Description
HouseNumberHigh	The ending house number for the range in which the candidate address's house number falls.
HouseNumberLow	The beginning house number for the range in which the candidate address's house number falls.
HouseNumberParity	<p>Indicates the numbering scheme for the house numbers between HouseNumberLow and HouseNumberHigh, as follows:</p> <p>E Only even values</p> <p>O Only odd values</p> <p>B Both</p>
MatchLevel	<p>For addresses outside the U.S. and Canada, identifies the match level for the candidate address. U.S. and Canadian addresses are always "A." One of the following:</p> <p>A The candidate matches the input address at the street level.</p> <p>B The candidate matches the input address at the state/province level.</p>
PostalCode	The postal code. In the U.S. this is the ZIP Code™.
PostalCode.AddOn	The last four digits of the ZIP + 4® Code. U.S. addresses only.
RecordType	<p>The type of address record, as defined by U.S. and Canadian postal authorities (U.S. and Canadian addresses only):</p> <ul style="list-style-type: none"> • FirmRecord • GeneralDelivery • HighRise • PostOfficeBox • RRHighwayContract • Normal

columnName	Description
RecordType.Default	Code indicating the "default" match: Y The address matches a default record. null The address does not match a default record.
StateProvince	The state or province abbreviation.
Status	Reports the success or failure of the match attempt. null Success F Failure
Status.Code	The reason for failure, if there is one. There is only one possible value: <ul style="list-style-type: none"> • DisabledCoder • RequestFailed
Status.Description	A description of the problem, if there is one. Did not return multiples The input address matched only one address in the database. GetCandidateAddresses only returns data if multiple possible matches were found. Number of candidates is not greater than 1 The input address matched more than one address in the database but no addresses were returned. PerformUSProcessing disabled This value will appear if Status.Code=DisabledCoder. PerformCanadianProcessing disabled This value will appear if Status.Code=DisabledCoder. PerformInternationalProcessing disabled This value will appear if Status.Code=DisabledCoder.
UnitNumberHigh	The ending unit number for the range in which the candidate address's unit number falls.

columnName	Description						
UnitNumberLow	The beginning unit number for the range in which the candidate address's unit number falls.						
UnitNumberParity	Indicates the numbering scheme for the unit numbers between UnitNumberLow and UnitNumberHigh, as follows: <table border="0" data-bbox="552 577 974 714"> <tr> <td>E</td> <td>Only even values</td> </tr> <tr> <td>O</td> <td>Only odd values</td> </tr> <tr> <td>B</td> <td>Both</td> </tr> </table>	E	Only even values	O	Only odd values	B	Both
E	Only even values						
O	Only odd values						
B	Both						
USUrbanName	The validated city urbanization name. Urbanization names are used primarily for Puerto Rico addresses.						

GetCandidateAddressesLoqate

GetCandidateAddressesLoqate returns a list of addresses that are considered matches for a given input address. GetCandidateAddressesLoqate returns candidate addresses only if the input address matches multiple addresses in the postal database. If the input address matches only one address in the postal database, then no address data is returned. The Country input field is required; if this field is blank, no output will be returned.

Note: By default, GetCandidateAddressesLoqate does not match to individual house numbers. Rather, it uses house number ranges for each street. After GetCandidateAddressesLoqate has determined the street name, city name, state/province name, and postal code, it checks to make sure the input house number falls within one of the ranges of house numbers given for the matched street name. The same type of logic applies to unit numbers.

GetCandidateAddressesLoqate is part of the Universal Addressing Module.

Input

The following table lists the input for GetCandidateAddressesLoqate.

Table 82: Input Format

columnName	Description
AddressLine1	The first address line.
AddressLine2	The second address line.
AddressLine3	The third address line.
AddressLine4	The fourth address line.
City	The city name.
Country	<p>The country code or name, in any of the following formats:</p> <ul style="list-style-type: none"> • 2-digit ISO country code • 3-digit UPU Country code • English country name <p>For a list of ISO codes, see ISO Country Codes and Module Support on page 788.</p> <p>Note: This field is required. If this field is blank, no output will be returned.</p>
FirmName	The company or firm name.
PostalCode	The postal code for the address. For U.S. addresses this is the ZIP Code™ in one of the following formats:
StateProvince	<p>The state or province.</p> <p>For U.S. addresses only, you may put the state in the City field instead of the StateProvince field.</p>

Options

Table 83: GetCandidateAddressesLoqate Options

optionName	Description
Database.Loqate	Specifies the database to be used for address processing. Only databases that have been defined in the Management Console are available.
OutputCasing	<p>Specifies the casing of the output data. One of the following:</p> <p>M Returns the output in mixed case (default). For example:</p> <p>123 Main St Mytown FL 12345</p> <p>U Returns the output in upper case. For example:</p> <p>123 MAIN ST MYTOWN FL 12345</p>
CandidateProcessOption	<p>Specifies the method of searching for candidates. One of the following:</p> <p>S Enter a full or partial address as input and return as output a list of closely matching results (default).</p> <p>V Enter address information in address lines, address components, or a combination of both as input and return as output results that more closely match the input.</p>

optionName	Description
HomeCountry	<p>Specifies the default country. You should specify the country where most of your addresses reside. For example, if most of the addresses you process are in Germany, specify Germany. GetCandidateAddressLoqate uses the country you specify to attempt validation when it cannot determine the country from the StateProvince, PostalCode, and Country address fields. The valid country names are:</p> <p>Afghanistan, Albania, Algeria, American Samoa, Andorra, Angola, Anguilla, Antigua And Barbuda, Argentina, Armenia, Aruba, Australia, Austria, Azerbaijan, Bahamas, Bahrain, Bangladesh, Barbados, Belarus, Belgium, Belize, Benin, Bermuda, Bhutan, Bolivia, Bosnia And Herzegovina, Botswana, Brazil, British Virgin Islands, Brunei Darussalam, Bulgaria, Burkina Faso, Burundi, Cambodia, Cameroon, Canada, Cape Verde, Cayman Islands, Central African Republic, Chad, Chile, China, Colombia, Comoros Islands, Congo, Cook Islands, Costa Rica, Cote D'Ivoire, Croatia, Cuba, Cyprus, Czech Republic, Democratic Republic Of Congo, Denmark, Djibouti, Dominica, Dominican Republic, East Timor, Ecuador, Egypt, El Salvador, Equatorial Guinea, Eritrea, Estonia, Ethiopia, Falkland Islands, Faroe Islands, Federated States Of Micronesia, Fiji, Finland, France, French Guiana, Gabon, Gambia, Germany, Ghana, Gibraltar, Greece, Greenland, Grenada, Guadeloupe, Guam, Guatemala, Guinea, Guinea Bissau, Guyana, Haiti, Holy See, Honduras, Hong Kong, Hungary, Iceland, India, Indonesia, Iran, Iraq, Ireland, Israel, Italy, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Kiribati, Korea, Kuwait, Kyrgyzstan, Laos, Latvia, Lebanon, Lesotho, Liberia, Libya, Liechtenstein, Lithuania, Luxembourg, Macau, Macedonia, Madagascar, Malawi, Malaysia, Maldives, Mali, Malta, Marshall Islands, Martinique, Mauritania, Mauritius, Mayotte, Mexico, Moldova, Monaco, Mongolia, Monserrat, Morocco, Mozambique, Myanmar, Namibia, Nauru, Nepal, Netherlands Antilles, New Caledonia, New Zealand, Nicaragua, Niger, Nigeria, Niue, Norway, Oman, Pakistan, Palau, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Pitcairn Islands, Poland, Portugal, Puerto Rico, Qatar, Republic Of Georgia, Republic Of Korea, Republic Of Singapore, Reunion, Romania, Russia, Rwanda, Saint Helena, Saint Kitts And Nevis, Saint Lucia, Saint Pierre And Miquelon, Saint Vincent And The Grenadines, Samoa, San Marino, Sao Tome and Principe, Saudi Arabia, Senegal, Seychelles, Sierra Leone, Slovakia, Slovenia, Solomon Islands, Somalia, South Africa, Spain, Sri Lanka, Sudan, Suriname, Swaziland, Sweden, Switzerland, Syria, Tahiti, Taiwan, Tajikistan, Tanzania, Thailand, The Netherlands, Togo, Tonga, Trinidad And Tobago, Tristan Da Cunha, Tunisia, Turkey, Turkmenistan, Turks And Caicos Islands, Tuvalu, Uganda, Ukraine, United Arab Emirates, United Kingdom, United States, Uruguay, Uzbekistan, Vanuatu, Venezuela, Vietnam, Virgin Islands (US), Wallis And Futuna, Yemen, Yugoslavia, Zambia, Zimbabwe</p>
OutputCountryFormat	<p>Specifies the format to use for the country name returned in the Country output field. For example, if you select English, the country name "Deutschland" would be returned as "Germany".</p> <ul style="list-style-type: none"> <li data-bbox="553 1675 1062 1709">E Use English country names (default). <li data-bbox="553 1724 1377 1787">I Use two-letter ISO abbreviation for the countries instead of country names. <li data-bbox="553 1801 1386 1864">U Use Universal Postal Union abbreviation for the countries instead of country names.

optionName	Description
OutputScript	<p>Specifies the alphabet or script in which the output should be returned. This option is bi-directional and generally takes place from Native to Latin and Latin to Native.</p> <p>Input Do not perform transliteration and provide output in the same script as the input (default).</p> <p>Native Output in the native script for the selected country wherever possible.</p> <p>Latn Use English values.</p>
MaximumResults	The maximum number of candidate addresses that GetCandidateAddressesLoqate should return. The default is 10. The maximum is 99.

Output

GetCandidateAddressesLoqate returns the following output.

Table 84: GetCandidateAddressesLoqate Output

columnName	Description
AddressLine1	The first address line.
AddressLine2	The second address line.
AddressLine3	The third address line.
AddressLine4	The fourth address line.
City	The city name.
Country	The three-character ISO 3166-1 Alpha 3 code for the country. For a list of ISO codes, see ISO Country Codes and Module Support on page 788.

columnName	Description
FirmName	The firm name.
PostalCode	The postal code. In the U.S. this is the ZIP Code™.
PostalCode.AddOn	The last four digits of the ZIP + 4® Code. U.S. addresses only.
ProcessedBy	Indicates which address coder processed the address. LOQATE The Loqate coder processed the address.
StateProvince	The state or province abbreviation.
Status	Reports the success or failure of the match attempt. null Success F Failure
Status.Code	The reason for failure, if there is one. There is only one possible value: • RequestFailed
Status.Description	A description of the problem, if there is one. There is only one possible value: Did not return multiples The input address matched only one address in the database. GetCandidateAddressesLoqate only returns data if multiple possible matches were found.

GetCityStateProvince

GetCityStateProvince returns a city and state/province for a given input postal code.

Note: GetCityStateProvince works with U.S. and Canadian addresses only.

GetCityStateProvince is part of the Universal Addressing Module.

Input

The following table shows the input fields.

Table 85: GetCityStateProvince Input

columnName	Description
PostalCode	A U.S. ZIP Code™ or Canadian postal code in one of the following formats: 99999 99999-9999 A9A9A9 A9A 9A9

Options

Table 86: GetCityStateProvince Options

optionName	Description
PerformUSProcessing	<p>Specifies whether or not to process U.S. addresses. If you enable U.S. address processing GetCityStateProvince will attempt to return the state for U.S. addresses. If you disable U.S. address processing, U.S. addresses will fail, meaning they are returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for U.S. address processing you must disable U.S. address processing in order for your jobs to complete successfully, regardless of whether or not they contain U.S. addresses.</p> <p>Note: You must have a valid license for U.S. address processing to successfully process U.S. addresses. If you enable U.S. address processing but are not licensed for this feature, or your license has expired, you will receive an error. If you enable U.S. address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p>Y Yes, process U.S. addresses (default).</p> <p>N No, do not process U.S. addresses.</p>
Database.US	Specifies the database to be used for U.S. address processing. Only databases that have been defined in the US Database Resources panel in the Management Console are available.

optionName	Description
PerformCanadianProcessing	<p>Specifies whether or not to process Canadian addresses. If you enable Canadian address processing GetCityStateProvince will attempt to return the province for Canadian addresses. If you disable Canadian address processing, Canadian addresses will fail, meaning they are returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for Canadian address processing you must disable Canadian address processing in order for your jobs to complete successfully, regardless of whether or not they contain Canadian addresses.</p> <p>Note: You must have a valid license for Canadian address processing to successfully process Canadian addresses. If you enable Canadian address processing but are not licensed for this feature, or your license has expired, you will receive an error. If you enable Canadian address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p>Y Yes, process Canadian addresses (default).</p> <p>N No, do not process Canadian addresses.</p>
Database.Canada	<p>Specifies the database to be used for Canadian address processing. Only databases that have been defined in the Canadian Database Resources panel in the Management Console are available.</p>
OutputVanityCity	<p>Specifies whether or not to include non-mailing city names in the output. A non-mailing city name is an alternate name for the primary city name. For example, Hollywood is a non-mailing city name for Los Angeles.</p> <p>Y Yes, include non-mailing city names.</p> <p>N No, do not include non-mailing city names (default).</p>
MaximumResults	<p>Specifies the maximum number of city-state/province pairs to return. The default value is 10.</p>

Output

GetCityStateProvince returns the matching city and state/province for the input postal code as well as a code to indicate the success or failure of the match attempt. If more than one city/state or city/province matches the input postal code, multiple output records are returned.

Table 87: GetCityStateProvince Output

columnName	Description
City	The matched city name.
City.Type	The USPS® standardized city name type (U.S. addresses only). V Vanity (non-mailing) city name. P Primary. The city name is the primary mailing city name. S Secondary. The city name is an alternate city name but is acceptable. A city can have multiple secondary city names.
PostalCode	The input postal code.
ProcessedBy	Indicates which address coder processed the address. One of the following: USA The U.S. address coder processed the address. CAN The Canadian address coder processed the address.
StateProvince	The state or province abbreviation.
Status	Reports the success or failure of the match attempt. null Success F Failure
Status.Code	The reason for failure, if there is one. The only valid value is: <ul style="list-style-type: none"> • DisabledCoder • UnrecognizedPostalCode

columnName	Description
Status.Description	<p>The description of the failure. The valid values are:</p> <p>Postal code not found This value will appear if Status.Code=UnrecognizedPostalCode.</p> <p>PerformUSProcessing disabled This value will appear if Status.Code=DisabledCoder.</p> <p>PerformCanadianProcessing disabled This value will appear if Status.Code=DisabledCoder.</p>

GetCityStateProvinceLoqate

GetCityStateProvinceLoqate returns a city and state/province for a given input postal code. This stage is part of the Universal Addressing Module.

Input

The following table shows the input fields.

Table 88: GetCityStateProvinceLoqate Input

columnName	Description
Country	<p>The country code or name, in any of the following formats:</p> <ul style="list-style-type: none"> • 2-digit ISO country code • 3-digit UPU Country code • English country name <p>For a list of ISO codes, see ISO Country Codes and Module Support on page 788.</p>
PostalCode	The postal code for the address.

Options

Table 89: GetCityStateProvinceLoqate Options

columnName	Description / Valid Values						
Database.Loqate	Specifies the database to be used for address processing. Only databases that have been defined in the Database Resources panel in the Management Console are available.						
MaximumResults	The maximum number of addresses that GetCityStateProvinceLoqate should return. The default is 10.						
OutputScript	<p>Specifies the alphabet or script in which the output should be returned. This option is bi-directional and generally takes place from Native to Latin and Latin to Native.</p> <table border="0"> <tr> <td>Input</td> <td>Do not perform transliteration and provide output in the same script as the input (default).</td> </tr> <tr> <td>Native</td> <td>Output in the native script for the selected country wherever possible.</td> </tr> <tr> <td>Latn</td> <td>Use English values.</td> </tr> </table>	Input	Do not perform transliteration and provide output in the same script as the input (default).	Native	Output in the native script for the selected country wherever possible.	Latn	Use English values.
Input	Do not perform transliteration and provide output in the same script as the input (default).						
Native	Output in the native script for the selected country wherever possible.						
Latn	Use English values.						
FailJobOnDataLicenseError	<p>Specifies how you want Spectrum Technology Platform to respond when a data license error occurs.</p> <table border="0"> <tr> <td>Fail the job</td> <td>Fail the entire job if a data license error occurs.</td> </tr> <tr> <td>Fail the record</td> <td>Fail the record(s) for which the data license error occurs and continue processing.</td> </tr> </table>	Fail the job	Fail the entire job if a data license error occurs.	Fail the record	Fail the record(s) for which the data license error occurs and continue processing.		
Fail the job	Fail the entire job if a data license error occurs.						
Fail the record	Fail the record(s) for which the data license error occurs and continue processing.						

Output

GetCityStateProvinceLoqate returns the matching city and state/province for the input postal code as well as a code to indicate the success or failure of the match attempt. If more than one city/state or city/province matches the input postal code, multiple output records are returned.

Table 90: GetCityStateProvinceLoqate Output

columnName	Description
City	The matched city name.
Country	The country in the format determined by what you selected in OutputCountryFormat: <ul style="list-style-type: none"> • ISO Code • UPU Code • English
PostalCode	The input postal code.
ProcessedBy	Indicates which address coder processed the address. LOQATE The Loqate coder processed the address.
StateProvince	The state or province abbreviation.
Status	Reports the success or failure of the match attempt. null Success F Failure
Status.Code	The reason for failure, if there is one. The only valid value is: <ul style="list-style-type: none"> • UnrecognizedPostalCode
Status.Description	The description of the failure. The only valid value is: Postal code not found This value will appear if Status.Code=UnrecognizedPostalCode.

GetPostalCodes

GetPostalCodes allows you to look up the postal codes for a particular city. The service takes a city, state, and country as input and returns the postal codes for that city. The input must be exactly correct in order to return postal codes.

Note: GetPostalCodes only works with U.S. addresses.

GetPostalCodes is part of the Universal Addressing Module.

Input

GetPostalCodes takes a city, state/province, and country as input.

Table 91: GetPostalCodes Input

columnName	Description
City	<p>The city whose postal codes you want to look up.</p> <p>You may put the city and state in the City field. If you do this, you must leave the StateProvince field blank.</p> <p>The total length of the City and StateProvince fields cannot exceed 100 characters.</p>
StateProvince	<p>The state or province of the city whose postal codes you want to look up.</p> <p>You may also put the state in the City field instead of the StateProvince field.</p> <p>The total length of the City and StateProvince fields cannot exceed 100 characters.</p>
Country	<p>The country code or name of the city whose postal codes you want to look up. The only valid value is US.</p>

Options

Table 92: GetPostalCodes Options

optionName	Description
Database.US	Specifies the database to be used for postal code look-ups. Only databases that have been defined in the US Database Resources panel in the Management Console are available.
IncludeVanityCity	<p>Specifies whether or not to include postal codes for the city's non-mailing city names. A non-mailing city name is an alternate name for the primary city name. For example, Hollywood is a non-mailing city name for Los Angeles.</p> <p>Y Yes, include postal codes for non-mailing city names.</p> <p>N No, do not include postal codes for non-mailing city names (default).</p>
OutputCityType	<p>Specifies whether or not to return the city type in the output. If enabled, the city type is returned in the City.Type field.</p> <p>Y Yes, include the city type in the output.</p> <p>N No, do not include the city type in the output (default).</p>

Output

GetPostalCodes returns the postal codes for a specified city. Each postal code is returned in a separate record along with the data listed in the following table.

Table 93: GetPostalCodes Output

columnName	Description
City.Type	<p>The USPS® city type (U.S. addresses only). The city type is determined by looking at the ZIP Code and the city name. For example, the city Lanham MD has the postal codes 20703, 20706, and 20784. Lanham is the primary city in 20703 and 20706 but is a vanity city in 20784.</p> <p>This field column is only populated if <code>OutputCityType=Y</code>. The possible values are:</p> <p>V Vanity (non-mailing) city name.</p> <p>P Primary. The city name is the primary mailing city name.</p> <p>S Secondary. The city name is an alternate city name but is acceptable. A city can have multiple secondary city names.</p>
PostalCode	A postal code in the specified city.
ProcessedBy	Because this service only works for U.S. addresses, ProcessedBy will always contain one value: USA.
Status	<p>Reports the success or failure of the match attempt.</p> <p>null Success</p> <p>F Failure</p>
Status.Code	<p>Reason for failure, if there is one. One of the following:</p> <ul style="list-style-type: none"> CountryNotSupported UnableToLookup
Status.Description	<p>Description of failure.</p> <ul style="list-style-type: none"> Input country is not supported Input city was blank Input city & state / province was blank, or no match found City-state mismatch (different spelling found, or city-state was a vanity name and vanity matching was not allowed, or city-state did not match ZIP Code)

GetPostalCodesLoqate

GetPostalCodesLoqate allows you to look up the postal codes for a particular city. The service takes a city, state, and country as input and returns the postal codes for that city. The input must be exactly correct in order to return postal codes.

GetPostalCodesLoqate is part of the Universal Addressing Module.

Input

GetPostalCodesLoqate takes a city, state/province, and country as input.

Table 94: GetPostalCodesLoqate Input

columnName	Description / Valid Values
City	<p>The city whose postal codes you want to look up.</p> <p>You may put the city and state in the City column. If you do this, you must leave the StateProvince column blank.</p>
Country	<p>The country code or name, in any of the following formats:</p> <ul style="list-style-type: none"> • 2-digit ISO country code • 3-digit UPU Country code • English country name <p>For a list of ISO codes, see ISO Country Codes and Module Support on page 788.</p>
StateProvince	<p>The state or province of the city whose postal codes you want to look up.</p> <p>You may also put the state in the City column instead of the StateProvince column.</p>

Options

Table 95: GetPostalCodesLoqate Options

optionName	Description/Valid Values				
Database.Loqate	Specifies the database to be used for postal code look-ups. Only databases that have been defined in the Management Console are available.				
FailJobOnDataLicenseError	Specifies how you want Spectrum Technology Platform to respond when a data license error occurs. <table border="0" data-bbox="552 756 1421 871"> <tr> <td>Fail the job</td> <td>Fail the entire job if a data license error occurs.</td> </tr> <tr> <td>Fail the record</td> <td>Fail the record(s) for which the data license error occurs and continue processing.</td> </tr> </table>	Fail the job	Fail the entire job if a data license error occurs.	Fail the record	Fail the record(s) for which the data license error occurs and continue processing.
Fail the job	Fail the entire job if a data license error occurs.				
Fail the record	Fail the record(s) for which the data license error occurs and continue processing.				

Output

GetPostalCodesLoqate returns the postal codes for a specified city. Each postal code is returned in a separate record along with the data listed in the following table.

Table 96: GetPostalCodesLoqate Output

columnName	Description / Valid Values				
PostalCode	A postal code in the specified city.				
ProcessedBy	Indicates which address coder processed the address. <table border="0" data-bbox="552 1501 1421 1543"> <tr> <td>LOQATE</td> <td>The Loqate coder processed the address.</td> </tr> </table>	LOQATE	The Loqate coder processed the address.		
LOQATE	The Loqate coder processed the address.				
Status	Reports the success or failure of the match attempt. <table border="0" data-bbox="552 1659 1421 1753"> <tr> <td>null</td> <td>Success</td> </tr> <tr> <td>F</td> <td>Failure</td> </tr> </table>	null	Success	F	Failure
null	Success				
F	Failure				

columnName	Description / Valid Values
Status.Code	Reason for failure, if there is one. One of the following: <ul style="list-style-type: none"> InvalidCountry UnableToLookup
Status.Description	Description of failure. <ul style="list-style-type: none"> Input country is not supported Input city was blank Input city & state / province was blank, or no match found

ValidateAddress

ValidateAddress standardizes and validates addresses using postal authority address data. ValidateAddress can correct information and format the address using the format preferred by the applicable postal authority. It also adds missing postal information, such as postal codes, city names, state/province names, and more.

ValidateAddress also returns result indicators about validation attempts, such as whether or not ValidateAddress validated the address, the level of confidence in the returned address, the reason for failure if the address could not be validated, and more.

During address matching and standardization, ValidateAddress separates address lines into components and compares them to the contents of the Universal Addressing Module databases. If a match is found, the input address is *standardized* to the database information. If no database match is found, ValidateAddress optionally *formats* the input addresses. The formatting process attempts to structure the address lines according to the conventions of the appropriate postal authority.

ValidateAddress is part of the Universal Addressing Module.

Input

ValidateAddress takes an address as input. All addresses use this format regardless of the address's country. See [Address Line Processing for U.S. Addresses](#) on page 619 for important information about how address line data is processed for U.S. addresses.

Table 97: Input Format

columnName	Format	Description
AddressLine1	String [50]	The first address line.
AddressLine2	String [50]	The second address line.
AddressLine3	String [50]	The third address line. Does not apply to Canadian addresses.
AddressLine4	String [50]	The fourth address line. Does not apply to Canadian addresses.
AddressLine5	String [50]	The fifth address line. Applies only to U.K. addresses. May contain street name, unit number, building number, and so on.
City	String [50]	The city name. For U.S. addresses only, you may put the city, state, and ZIP Code™ in the City field. If you do this, you must leave the StateProvince and PostalCode fields blank.
StateProvince	String [50]	The state or province. For U.S. addresses only, you may put the state in the City field instead of the StateProvince field.

columnName	Format	Description
PostalCode	String [10]	<p>The postal code for the address in one of the following formats:</p> <p>99999 99999-9999 A9A9A9 A9A 9A9 9999 999</p> <p>For U.S. addresses only, you may put the ZIP Code™ in the City field.</p> <p>For U.S. addresses only, if the city/state/ZIP Code™ is in the PostalCode field, ValidateAddress may parse the data and successfully process the address. For best results, put this data in the appropriate fields (City, StateProvince, and PostalCode).</p>
Country	String [50]	<p>The country code or name, in any of the following formats:</p> <ul style="list-style-type: none"> • Two-character ISO 3166-1 Alpha 2 country code • Three-character ISO 3166-1 Alpha 3 country code • English country name • French country name • German country name • Spanish country name <p>For a list of ISO codes, see ISO Country Codes and Module Support on page 788.</p>
FirmName	String [50]	The company or firm name.
USUrbanName	String [50]	The U.S. address urbanization name. This is used primarily for Puerto Rico addresses.
CustomerID	String [9]	If this mailpiece uses a generic barcode, specify your USPS®-assigned customer ID in this field. The ValidateAddress generic barcode is used for mailpieces that use the OneCode ACS® service.
CanLanguage	String	<p>For Canadian addresses only, indicates whether the address is in English or French, if the option <code>CanFrenchFormat=T</code> is used.</p> <p>If this field is blank, the address is formatted in English. If the field contains any non-blank value, the address is formatted in French. Note that addresses in Quebec are always formatted in French regardless of the value in this field.</p>

Address Line Processing for U.S. Addresses

The input fields AddressLine1 through AddressLine4 are handled differently for U.S. addresses depending on whether the firm name extraction or urbanization code extraction options are enabled. If either of these options is enabled, ValidateAddress will look at the data in all four fields to validate the address and extract the requested data (firm name and/or urbanization code). If neither of these options is enabled, ValidateAddress uses only the first two non-blank address line fields in its validation attempt. The data in the other address line fields is returned in the output field AdditionalInputData. For example,

AddressLine1: A1 Calle A

AddressLine2:

AddressLine3: URB Alamar

AddressLine4: Pitney Bowes

In this address, if either firm name extraction or urbanization code extraction were enabled, ValidateAddress would examine all four address lines. If neither firm name extraction nor urbanization code extraction were enabled, ValidateAddress would examine AddressLine1 and AddressLine3 (the first two non-blank address lines) and attempt to validate the address using that data; the data in AddressLine4 would be returned in the output field AdditionalInputData.

Options

Output Data Options

The following table lists the options that control the type of information returned by ValidateAddress. Some of these options can be overridden for Canadian addresses. For more information, see [Canadian Address Options](#) on page 647.

Table 98: Output Data Options

optionName	Description
OutputRecordType	<p>Type of output record. For more than one, provide a list.</p> <ul style="list-style-type: none"> <li data-bbox="691 485 1421 894">A Returns 1 to 4 lines of address data plus city, state, postal code, firm name, and urbanization name information. Each address line represents an actual line of the address as it would appear on an envelope. For more information, see Standard Address Output on page 658. If the address is validated, the address lines contain the standardized address. When addresses are standardized, punctuation is removed, directionals are abbreviated, street suffixes are abbreviated, and address elements are corrected. If the address is not validated, the address lines contain the address as it appeared in the input ("pass through" data). Non-validated addresses are always included as pass through data in the address line fields even if you do not specify <code>OutputRecordType=A</code>. <li data-bbox="691 915 1421 1157">E Parsed address elements. Each part of the address, such as house number, street name, street suffix, directionals, and so on is returned in a separate field. For more information, see Parsed Address Elements Output on page 731. Note that if you specify "E" and specify <code>OutputFormattedOnFail=Y</code>, the parsed address elements will contain the input address for addresses that could not be validated. <li data-bbox="691 1178 1421 1461">I Parsed input. This option returns the input address in parsed form regardless of whether the address is validated. Each part of the input address, such as house number, street name, street suffix, directionals, and so on is returned in a separate field. Parsed input (value "I") differs from the combination of <code>OutputRecordType=E</code> and <code>OutputFormattedOnFail=Y</code> in that "I" returns all input address in parsed form, not just input that could not be validated. For more information, see Parsed Input on page 734. <li data-bbox="691 1482 1421 1577">P Postal data. Output addresses contain additional data for each validated address. For more information, see Postal Data Output on page 664. <li data-bbox="691 1598 1421 1625">Blank Do not return any address data or postal data.

optionName	Description				
OutputFieldLevelReturnCodes	<p data-bbox="678 373 1438 554">Specifies whether to include field-level result indicators. Field-level result indicators describe how each address element was handled. Field-level result indicators are returned in the qualifier "Result". For example, the field-level result indicator for HouseNumber is contained in HouseNumber.Result. For a complete listing of result indicator output fields, see Field-Level Result Indicators on page 671.</p> <table data-bbox="678 567 1438 646"><tr><td data-bbox="678 567 711 600">N</td><td data-bbox="808 567 1438 600">No, do not output field-level return codes (default).</td></tr><tr><td data-bbox="678 613 711 646">Y</td><td data-bbox="808 613 1438 646">Yes, output field-level return codes.</td></tr></table>	N	No, do not output field-level return codes (default).	Y	Yes, output field-level return codes.
N	No, do not output field-level return codes (default).				
Y	Yes, output field-level return codes.				

optionName	Description
OutputFormattedOnFail	<p data-bbox="678 373 1429 491">Specifies whether to return a formatted address when an address cannot be validated. The address is formatted using the preferred address format for the address's country. If this option is not selected, the output address fields are blank when the address cannot be validated.</p> <p data-bbox="764 506 1406 596">Note: This option applies only to U.S. and Canadian addresses. Formatted data will not be returned for any other address.</p> <p data-bbox="686 625 1284 659">N No, do not format failed addresses (default).</p> <p data-bbox="686 674 1125 707">Y Yes, format failed addresses.</p> <p data-bbox="678 728 1429 1014">Formatted addresses are returned using the format specified by the <code>OutputRecordType</code> option. Note that if you specify <code>OutputRecordType=E</code>, the parsed address elements will contain the parsed, validated address for addresses that could be validated. If the address could not be validated the parsed address elements will contain the input address in parsed form. If you always want the output to contain the input address in parsed form, regardless of whether or not <code>ValidateAddress</code> could validate the address, specify <code>OutputRecordType=I</code>.</p> <p data-bbox="678 1031 1429 1316">Formatted addresses are returned using the format specified by the <code>Option.OutputRecordType</code> option. Note that if you specify <code>Option.OutputRecordType=E</code>, the parsed address elements will contain the parsed, validated address for addresses that could be validated. If the address could not be validated the parsed address elements will contain the input address in parsed form. If you always want the output to contain the input address in parsed form, regardless of whether or not <code>ValidateAddress</code> could validate the address, specify <code>Option.OutputRecordType=I</code>.</p> <p data-bbox="678 1333 1429 1631">Formatted addresses are returned using the format specified by the Include a standard address, Include address line elements, and Include postal information check boxes. Note that if you select Include address line elements, the parsed address elements will contain the parsed, validated address for addresses that could be validated. If the address could not be validated the parsed address elements will contain the input address in parsed form. If you always want the output to contain the input address in parsed form, regardless of whether or not <code>ValidateAddress</code> could validate the address, select Include standardized input address elements.</p> <p data-bbox="678 1646 1429 1677">If you specify Y, you must specify "A" and/or "E" for <code>OutputRecordType</code>.</p> <p data-bbox="678 1690 1222 1755">If you specify Y, you must specify "A" and/or "E" for <code>Option.OutputRecordType</code>.</p> <p data-bbox="678 1770 1429 1829">If you check this option, you must select Include a standard address and/or Include address line elements.</p>

optionName	Description
OutputStreetNameAlias	<p data-bbox="678 373 1429 464">For U.S. addresses only, specifies how to handle street name aliases used in the input. A street alias is an alternate name for a street and applies only to a specific range of addresses on the street.</p> <p data-bbox="678 478 1429 598">If you enable this option, street name aliases used in the input will appear in the output. If you do not enable this option, street name aliases in the input will be converted to the base street name in the output, with the following exceptions:</p> <ul data-bbox="678 613 1429 741" style="list-style-type: none"><li data-bbox="678 613 1429 674">• If a preferred alias is used in input the preferred alias will always be used in output.<li data-bbox="678 680 1429 741">• Changed aliases used in input are always converted to the base street name in output. <p data-bbox="678 756 1429 856">This is one of three options that control how <code>ValidateAddress</code> handles street name aliases. The other two are <code>OutputPreferredAlias</code> and <code>OutputAbbreviatedAlias</code>.</p> <p data-bbox="764 871 1429 972">Note: If <code>OutputAbbreviatedAlias</code> is enabled, the abbreviated alias will always appear in the output even if you have <code>OutputStreetNameAlias</code> disabled.</p> <p data-bbox="678 987 1429 1117">N No, do not return street name aliases in the output. Y Yes, return street name aliases in the output if the input street name is an alias (default).</p>

optionName	Description
OutputAddressBlocks	<p>Specifies whether to return a formatted version of the address as it would be printed on a physical mailpiece. Each line of the address is returned in a separate address block field. There can be up to nine address block output fields: AddressBlock1 through AddressBlock9.</p> <p>For example, this input address:</p> <p>AddressLine1: 4200 Parliament Place AddressLine2: Suite 600 City: Lanham StateProvince: MD PostalCode: 20706</p> <p>Results in this address block output:</p> <p>AddressBlock1: 4200 PARLIAMENT PL STE 600 AddressBlock2: LANHAM MD 20706-1882 AddressBlock3: UNITED STATES OF AMERICA</p> <p>ValidateAddress formats the address into address blocks using postal authority standards. The country name is returned using the Universal Postal Union country name. Note that the option <code>OutputCountryFormat</code> does not affect the country name in the address block, it only affects the name returned in the Country output field.</p> <p>For addresses outside the U.S. and Canada, if ValidateAddress is unable to validate the address, no address blocks are returned. For addresses in the U.S. and Canada, address blocks are returned even if validation fails.</p> <p>N No, do not return address blocks. Default.</p> <p>Y Yes, return address blocks.</p>

optionName	Description
OutputAMAS	<p>Specifies whether to return a formatted version of the address as it would be printed on a physical mailpiece. Each line of the address is returned in a separate address block field. There can be up to nine address block output fields: AddressBlock1 through AddressBlock9.</p> <p>For example, this input address:</p> <p>AddressLine1: 4200 Parliament Place AddressLine2: Suite 600 City: Lanham StateProvince: MD PostalCode: 20706</p> <p>Results in this address block output:</p> <p>AddressBlock1: 4200 PARLIAMENT PL STE 600 AddressBlock2: LANHAM MD 20706-1882 AddressBlock3: UNITED STATES OF AMERICA</p> <p>ValidateAddress formats the address into address blocks using postal authority standards. The country name is returned using the Universal Postal Union country name. Note that the option <code>OutputCountryFormat</code> does not affect the country name in the address block, it only affects the name returned in the Country output field.</p> <p>For addresses outside the U.S. and Canada, if ValidateAddress is unable to validate the address, no address blocks are returned. For addresses in the U.S. and Canada, address blocks are returned even if validation fails.</p> <p>N No, do not return address blocks. Default. Y Yes, return address blocks.</p>

Obtaining Congressional Districts

ValidateAddress can determine the U.S. congressional district for an address.

To obtain congressional districts, `OutputRecordType` must contain P. For more information on `OutputRecordType`, see [Output Data Options](#) on page 619.

Table 99: Congressional District Output

columnName	Description
USCongressionalDistrict	Congressional district number. If the address is a non-state address (for example Puerto Rico or Washington D.C.) this field is blank.

Obtaining County Names

ValidateAddress can determine the county where a particular address is located and return the county name.

Note: County names are available for U.S. addresses only.

To obtain county names, `OutputRecordType` must contain P. For more information on `OutputRecordType`, see [Output Data Options](#) on page 619.

Table 100: County Name Output

columnName	Description
USCountyName	County name

Obtaining FIPS County Numbers

Federal Information Processing Standards (FIPS) county numbers are numbers that identify each county in a state. Note that these numbers are only unique at the state level, not the national level. For more information, see <http://www.census.gov>.

Note: FIPS county numbers are available for U.S. addresses only.

To obtain FIPS county numbers, `OutputRecordType` must contain P. For more information on `OutputRecordType`, see [Output Data Options](#) on page 619.

Table 101: FIPS County Number Output

columnName	Description
USFIPSCountyNumber	FIPS (Federal Information Processing Standards) county number

Obtaining Carrier Route Codes

Carrier route codes are unique identifiers assigned to each mail carrier who delivers mail, allowing unique identification of each U.S. delivery route. ValidateAddress can return the code that represents an addressee's carrier route.

Note: Carrier route codes are available for U.S. addresses only.

To obtain carrier route codes, `OutputRecordType` must contain P. For more information on `OutputRecordType`, see [Output Data Options](#) on page 619.

Table 102: Carrier Route Code Output

columnName	Description
------------	-------------

USCarrierRouteCode	Carrier route code
--------------------	--------------------

Creating Delivery Point Barcodes

A Delivery Point Barcode (DPBC) is a POSTNET™ barcode representation of the address. It consists of 62 bars with beginning and ending frame bars and five bars each for the ZIP + 4® Code, a value calculated based on the street address number, and a correction digit. The DPBC allows automated sortation of letter mail to the carrier level in walk sequence. `ValidateAddress` generates the data you need to assemble a DPBC.

Note: Delivery Point Barcodes are available for U.S. addresses only. For more information on Delivery Point Barcodes, see <http://www.usps.com>.

To generate the data needed to assemble a DPBC, `OutputRecordType` must contain P. For more information on `OutputRecordType`, see [Output Data Options](#) on page 619.

Table 103: Delivery Point Barcode Output

columnName	Description
------------	-------------

PostalBarCode	The delivery point portion of the delivery point barcode.
---------------	---

USBCCheckDigit	Check-digit portion of the 11-digit delivery point barcode.
----------------	---

To assemble a DPBC you concatenate the values found in the `ValidateAddress` output columns as follows:

`PostalCode.Base` + `PostalCode.Addon` + `PostalBarcode` + `USBCCheckDigit`

For example, if you have the following:

- **PostalCode.Base** = 49423
- **PostalCode.Addon** = 4506
- **PostalBarcode** = 29

- **USBCheckDigit = 2**

The assembled barcode would be:

494234506292

Default Options

The following table lists the options that control the format and processing of addresses. These are called "default options" because by default they apply to all addresses. Some of these options can be overridden for Canadian addresses. For more information, see [Canadian Address Options](#) on page 647.

Table 104: Default Options

optionName	Description
OutputCasing	<p>Specifies the casing of the output address. One of the following:</p> <p>M Returns the output in mixed case (default). For example:</p> <p>123 Main St Mytown FL 12345</p> <p>U Returns the output in upper case. For example:</p> <p>123 MAIN ST MYTOWN FL 12345</p>
OutputPostalCodeSeparator	<p>Specifies whether to use separators (spaces or hyphens) in ZIP™ Codes or Canadian postal codes.</p> <p>For example, a ZIP + 4® Code with the separator would be 20706-1844 and without the separator it would be 207061844. A Canadian postal code with the separator would be P5E"1S7 and without the separator it would be P5E1S7.</p> <p>Y Yes, use separator (default).</p> <p>N No, do not use separator.</p> <p>Note: Spaces are used in Canadian postal codes and hyphens in U.S. ZIP + 4® Codes.</p>

optionName	Description
OutputMultinationalCharacters	<p>Specifies whether or not to return multinational characters, including diacritical marks such as umlauts or accents. (Not supported for U.S. addresses).</p> <p>N No, do not use multinational characters in the output (default). Only standard ASCII characters is returned.</p> <p>Y Yes, use multinational characters in the output.</p>
KeepMultimatch	<p>Indicates whether or not to return multiple address for those input addresses that have more than one possible match.</p> <p>Y Yes, return multiple matches (default).</p> <p>N No, do not return multiple matches.</p> <p>For more information, see Returning Multiple Matches on page 633.</p>
StandardAddressFormat	<p>Specifies where to place secondary address information for U.S. addresses. Secondary address information refers to apartment numbers, suite numbers, and similar designators. For example, in this address the secondary address information is "Apt 10E" and the primary address information is "424 Washington Blvd".</p> <p>Apt 10E 424 Washington Blvd Springfield MI 49423</p> <p>C Place both primary and secondary address information in AddressLine1 (default).</p> <p>S Place the primary address information in AddressLine1 and the secondary address information in AddressLine2.</p> <p>D Place both primary and secondary address information in AddressLine1 and place dropped information from dual addresses in AddressLine2. A dual address is an address that contains both street information and PO Box/Rural Route/Highway Contract information. For more information, see About Dual Address Logic on page 632.</p>

optionName	Description
OutputShortCityName	<p>Specifies how to format city names that have short city name or non-mailing city name alternatives. Applies to U.S. and Canadian addresses.</p> <ul style="list-style-type: none">Y Returns the USPS®-approved abbreviation for the city, if there is one. The USPS® provides abbreviations for city names that are 14 characters long or longer. City abbreviations are 13 characters or less and can be used when there is limited space on the mailing label. If there is no short city name for the city, then the full city name is returned.N Returns the long city name (default).S Returns the abbreviated city name only if an abbreviated city name is used in the input address. If the input address does not use a short city name, either the long or short city name could be returned, depending on USPS® regulations for the particular city. Select this option if you are performing a CASS™ test.V Output the non-mailing city name (the vanity name) if the input city name is a non-mailing city name. For example, "Hollywood" is a non-mailing city name for "Los Angeles". If you do not select this option and the input city name is a non-mailing city name the long version of the mailing city is returned.
OutputCountryFormat	<p>Specifies the format to use for the country name returned in the Country output field. For example, if you select English, the country name "Deutschland" would be returned as "Germany".</p> <ul style="list-style-type: none">E Use English country names (default).S Use Spanish country names.F Use French country names.G Use German country names.I Use two-letter ISO abbreviation for the countries instead of country names.U Use Universal Postal Union abbreviation for the countries instead of country names.

optionName	Description
HomeCountry	<p>Specifies the default country. You should specify the country where most of your addresses reside. For example, if most of the addresses you process are in Canada, specify Canada. ValidateAddress uses the country you specify to attempt validation when it cannot determine the country from the StateProvince, PostalCode, and Country address fields. The valid country names are:</p> <p>Afghanistan, Albania, Algeria, American Samoa, Andorra, Angola, Anguilla, Antigua And Barbuda, Argentina, Armenia, Aruba, Australia, Austria, Azerbaijan, Bahamas, Bahrain, Bangladesh, Barbados, Belarus, Belgium, Belize, Benin, Bermuda, Bhutan, Bolivia, Bosnia And Herzegovina, Botswana, Brazil, British Virgin Islands, Brunei Darussalam, Bulgaria, Burkina Faso, Burundi, Cambodia, Cameroon, Canada, Cape Verde, Cayman Islands, Central African Republic, Chad, Chile, China, Colombia, Comoros Islands, Congo, Cook Islands, Costa Rica, Cote D'Ivoire, Croatia, Cuba, Cyprus, Czech Republic, Democratic Republic Of Congo, Denmark, Djibouti, Dominica, Dominican Republic, East Timor, Ecuador, Egypt, El Salvador, Equatorial Guinea, Eritrea, Estonia, Ethiopia, Falkland Islands, Faroe Islands, Federated States Of Micronesia, Fiji, Finland, France, French Guiana, Gabon, Gambia, Germany, Ghana, Gibraltar, Greece, Greenland, Grenada, Guadeloupe, Guam, Guatemala, Guinea, Guinea Bissau, Guyana, Haiti, Holy See, Honduras, Hong Kong, Hungary, Iceland, India, Indonesia, Iran, Iraq, Ireland, Israel, Italy, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Kiribati, Korea, Kuwait, Kyrgyzstan, Laos, Latvia, Lebanon, Lesotho, Liberia, Libya, Liechtenstein, Lithuania, Luxembourg, Macau, Macedonia, Madagascar, Malawi, Malaysia, Maldives, Mali, Malta, Marshall Islands, Martinique, Mauritania, Mauritius, Mayotte, Mexico, Moldova, Monaco, Mongolia, Monserrat, Morocco, Mozambique, Myanmar, Namibia, Nauru, Nepal, Netherlands Antilles, New Caledonia, New Zealand, Nicaragua, Niger, Nigeria, Niue, Norway, Oman, Pakistan, Palau, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Pitcairn Islands, Poland, Portugal, Puerto Rico, Qatar, Republic Of Georgia, Republic Of Korea, Republic Of Singapore, Reunion, Romania, Russia, Rwanda, Saint Helena, Saint Kitts And Nevis, Saint Lucia, Saint Pierre And Miquelon, Saint Vincent and the Grenadines, Samoa, San Marino, Sao Tome and Principe, Saudi Arabia, Senegal, Seychelles, Sierra Leone, Slovakia, Slovenia, Solomon Islands, Somalia, South Africa, Spain, Sri Lanka, Sudan, Suriname, Swaziland, Sweden, Switzerland, Syria, Tahiti, Taiwan, Tajikistan, Tanzania, Thailand, The Netherlands, Togo, Tonga, Trinidad And Tobago, Tristan Da Cunha, Tunisia, Turkey, Turkmenistan, Turks And Caicos Islands, Tuvalu, Uganda, Ukraine, United Arab Emirates, United Kingdom, United States, Uruguay, Uzbekistan, Vanuatu, Venezuela, Vietnam, Virgin Islands (US), Wallis And Futuna, Yemen, Yugoslavia, Zambia, Zimbabwe</p>

optionName	Description
DualAddressLogic	<p>Indicates how to return a match if multiple non-blank address lines are present or multiple address types are on the same address line. (U.S. addresses only.)</p> <p>N (Default) USPS® CASS™ regulations determine the address returned based on the following order of priority:</p> <ol style="list-style-type: none"> 1. PO Box 2. Firm 3. Highrise 4. Street 5. Rural Route 6. General Delivery <p>S Return a street match, regardless of the address line.</p> <p>P Return a PO Box match, regardless of the address line.</p> <p>For more information, see About Dual Address Logic on page 632.</p>

About Dual Address Logic

For U.S. addresses only, the `DualAddressLogic` option controls whether `ValidateAddress` should return a street match or a PO Box/Rural Route/Highway Contract match when the address contains both street and PO Box/Rural Route/Highway Contract information in the same address line.

Note: The `DualAddressLogic` option has no effect if the street information is in a different address line input field than the PO Box/Rural Route/Highway Contract information.

For example, given the following input address:

AddressLine1: 401 N Main St Apt 1 POB 1
City: Kemp
StateProvince: TX
PostalCode: 75143

`ValidateAddress` would return one of the following:

- If `DualAddressLogic` is set to either N or P:

AddressLine1: PO Box 1
City: Kemp
StateProvince: TX
PostalCode: 75143-0001

- If `DualAddressLogic` is set to S:

AddressLine1: 401 N Main St Apt 1
 City: Kemp
 StateProvince: TX
 PostalCode: 75143-4806

The address data that is not used to standardize the address can be returned in one of two places:

- **AddressLine2**—The address information not used to standardize the address is returned in the **AddressLine2** field if you specify `StandardAddressFormat=D`. For more information, see [Default Options](#) on page 628. For example, if you choose to return a street match for dual addresses,

AddressLine1: 401 N Main St Apt 1
 AddressLine2: PO Box 1
 City: Kemp
 StateProvince: TX
 PostalCode: 75143-0001

- **AdditionalInputData**—If you do not specify `StandardAddressFormat=D` then the address information not used to standardize the address is returned in the **AdditionalInputData** field. For more information on this option, see [Default Options](#) on page 628. For example, if you choose to return a street match for dual addresses,

AddressLine1: 401 N Main St Apt 1
 City: Kemp
 StateProvince: TX
 PostalCode: 75143-0001
 AdditionalInputData: PO Box 1

Address information that is dropped can be retrieved by setting the `StandardAddressFormat` option to D. For more information, see [Default Options](#) on page 628 .

Returning Multiple Matches

If `ValidateAddress` finds multiple address in the postal database that are possible matches for the input address, you can have `ValidateAddress` return the possible matches. For example, the following address matches multiple addresses in the U.S. postal database:

PO BOX 1
 New York, NY

Options

To return multiple matches, use the options described in the following table.

Table 105: Multiple Match Option

optionName	Description
KeepMultimatch	<p>Indicates whether or not to return multiple address for those input addresses that have more than one possible match.</p> <p>Y Yes, return multiple matches (default).</p> <p>N No, do not return multiple matches.</p>
MaximumResults	<p>A number between 1 and 10 that indicates the maximum number of addresses to return.</p> <p>The default value is 1.</p> <p>Note: The difference between Keepmultimatch=N and KeepMultimatch=Y/MaximumResults=1 is that a multiple match will return a failure if KeepMultimatch=N, whereas a multiple match will return one record if KeepMultimatch=Y and MaximumResults=1.</p>
OutputFieldLevelReturnCodes	<p>To identify which output addresses are candidate addresses, you must specify a value of Y for OutputFieldLevelReturnCodes. When you do this, records that are candidate addresses will have one or more "M" values in the field-level result indicators.</p>

Output

When you choose to return multiple matches, the addresses are returned in the address format you specify. For information on specifying address format, see [Output Data Options](#) on page 619. To identify which records are the candidate addresses, look for multiple "M" values in the field-level result indicators. For more information, see [Field-Level Result Indicators](#) on page 671.

U.S. Address Options

optionName	Description
PerformUSProcessing	<p>Specifies whether to process U.S. addresses. If you enable U.S. address processing ValidateAddress will attempt to validate U.S. addresses. If you disable U.S. address processing, U.S. addresses will fail, meaning they are returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for U.S. address processing you must disable U.S. address processing in order for your jobs to complete successfully, regardless of whether or not they contain U.S. addresses.</p> <p>Note: You must have a valid license for U.S. address processing to successfully process U.S. addresses. If you enable U.S. address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p>N No, do not process U.S. addresses.</p> <p>Y Yes, process U.S. addresses. Default.</p>
Database.US	<p>Specifies which database to use for validating U.S. addresses. Only databases that have been defined in the US Database Resources panel in the Management Console are available.</p>
PerformLOT	<p>Enhanced Line of Travel (eLOT) processing assigns a Line of Travel sequence code to your addresses. Note that addresses are not sorted into eLOT sequence but they are assigned a Line of Travel sequence code that allows you to sort addresses into eLOT sequence.</p> <p>To perform eLOT processing you must have the eLOT database installed.</p> <p>N No, do not perform Line of Travel Processing. Default.</p> <p>Y Yes, perform Line of Travel processing.</p> <p>For a listing of the output fields returned by this option, see Enhanced Line of Travel Output on page 685.</p>

optionName	Description
PerformRDI	<p>Residential Delivery Indicator (RDI™) processing checks if an address is a residential address (not a business address). To perform RDI™ processing, you must have the RDI™ database installed.</p> <p>If you enable both DPV® and RDI™ processing, RDI™ information is only returned if the address is a valid delivery point. If DPV® does not validate the address no RDI™ data is returned.</p> <p>N No, do not perform Residential Delivery Indicator processing. Default.</p> <p>Y Yes, perform Residential Delivery Indicator processing.</p>
PerformESM	<p>Enhanced Street Matching (ESM) applies additional matching logic to correct misspelled or complex street names and obtain a match. ESM enables more addresses to be validated but it reduces performance. You cannot perform ESM when ASM is enabled.</p> <p>N No, do not perform enhanced street matching. Default.</p> <p>Y Yes, perform enhanced street matching.</p>
PerformASM	<p>All Street Matching (ASM) applies ESM processing as well as additional matching logic to correct errors in street names and obtain a match. It is effective at matching streets when the first letter of the street is incorrect. ASM provides the best address validation but reduces performance.</p> <p>N No, do not perform all street matching.</p> <p>Y Yes, perform all street matching. Default.</p>
PerformDPV	<p>Delivery Point Validation (DPV®) validates that a specific address exists, as opposed to validating that a specific address is within a range of valid addresses. CMRA processing checks if an address is for a mailbox rented from a private company, referred to as a Commercial Mail Receiving Agent (CMRA).</p> <p>To perform DPV and CMRA processing, you must have the DPV database installed. The DPV database contains both DPV and CMRA data.</p> <p>N No, do not perform Delivery Point Validation or CMRA processing. Default.</p> <p>Y Yes, perform Delivery Point Validation and CMRA processing.</p> <p>For a listing of the output fields returned by this option, see DPV and CMRA Output on page 688.</p>

optionName	Description
PerformLACSLink	<p>The USPS® Locatable Address Conversion System (LACS) allows you to correct addresses that have changed as a result of a rural route address converting to street-style address, a PO Box renumbering, or a street-style address changing. When enabled, LACS^{Link} processing is attempted for addresses that could not be validated, or addresses were validated and flagged for LACS^{Link} conversion.</p> <p>To perform LACS^{Link} processing, you must have the LACS^{Link} database installed.</p> <p>N No, do not attempt LACS^{Link} conversion. Default.</p> <p>Y Yes, attempt LACS^{Link} conversion.</p> <p>For a listing of the output fields returned by this option, see LACSLink Output on page 686</p>
PerformEWS	<p>The Early Warning System (EWS) uses the USPS® EWS File to validate addresses that are not in the ZIP + 4® database.</p> <p>To perform EWS processing, you must have the EWS database installed.</p> <p>If an input address matches an address in the EWS file, the following record-level result indicators are returned:</p> <ul style="list-style-type: none"> • Status="F" • Status.Code="EWSFailure" • Status.Description="Address found in EWS table" <p>N No, do not perform EWS processing. Default.</p> <p>Y Yes, perform EWS processing.</p>

optionName	Description
------------	-------------

ExtractFirm	
-------------	--

optionName

Description

Specifies whether to extract the firm name from AddressLine1 through AddressLine4 and place it in the FirmName output field. This option works in cases where the input record's FirmName field is blank and there is more than one address line.

Y Yes, extract the firm name.

N No, do not extract the firm name. Default.

To identify firm names in address lines, the address lines are scanned for keywords and patterns that identify which fields are address lines and which are FirmName lines. Since this is done based on patterns, fields may be misidentified. The following tips can help ensure optimal firm extraction:

- If possible, place the primary address elements in AddressLine1, the secondary elements in AddressLine2, Urbanization in AddressLine3, and firm in AddressLine4. If the address has no urbanization code, then place the firm name in AddressLine3 and leave AddressLine4 blank. For example,

AddressLine1: 4200 Parliament Place

AddressLine2: Suite 600

AddressLine3: Pitney Bowes

AddressLine4: <blank>

- When you define just two address lines, AddressLine2 is assigned to the secondary address most of the time. If you want to increase the chance that AddressLine2 will be treated as a firm name, put the firm name in AddressLine3 and leave AddressLine2 blank.
- Numbers in a firm name (such as the "1" in "1 Stop Software") will increase the likelihood that the field will be treated as an address line.

Here are some examples of firm name extraction:

- In this example, AddressLine2 would get extracted into the FirmName output field

FirmName: <blank>

AddressLine1: 4200 Parliament Place Suite 600

AddressLine2: International Goose Feathers inc.

- In this example, AddressLine3 would get extracted into the FirmName output field.

FirmName: <blank>

AddressLine1: 4200 Parliament Place

AddressLine2: Suite 600

AddressLine3: Pitney Bowes

- In this example, AddressLine3 would be placed in the AdditionalInputData output field. The firm name would not be extracted because the FirmName input field is not blank.

FirmName: International Goose Feathers Inc.

AddressLine1: 4200 Parliament Place

AddressLine2: Suite 600

AddressLine3: Pitney Bowes

- In this example, no firm name would be extracted because there is only one

optionName	Description
	<p>non-blank address line, which is always treated as the primary address element.</p> <p>FirmName: <blank> AddressLine1: 4200 Parliament Place Suite 600</p> <ul style="list-style-type: none"> In this example, AddressLine2 would be treated as a secondary address element because the numeral "1" causes that field to be treated as a secondary address element. <p>FirmName: <blank> AddressLine1: 4200 Parliament Place Suite 600 AddressLine2: 1 Stop Software</p>
ExtractUrb	<p>Specifies whether to extract the urbanization name from AddressLine1 through AddressLine4 and place it in the USUrbanName output field. This option works in cases where the input record's USUrbanName field is blank and there is more than one address line.</p> <p>Y Yes, extract the urbanization name.</p> <p>N No, do not extract the urbanization name. Default.</p> <p>To identify urbanization names, the address lines are scanned for keywords and patterns that identify which fields are address lines and which are urbanization name lines. Since this is done based on patterns, it is possible for fields to be incorrectly identified. To help ensure optimal urbanization extraction, place the primary address elements in AddressLine1, the secondary elements in AddressLine2, Urbanization in AddressLine3, and firm in AddressLine4, if possible. For example,</p> <p>AddressLine1: A1 Calle A AddressLine2: AddressLine3: URB Alamar AddressLine4: Pitney Bowes</p>

optionName	Description
PerformSuiteLink	<p data-bbox="553 373 1097 401">Specifies whether to perform Suite^{Link™} processing.</p> <p data-bbox="553 415 1429 537">Suite^{Link} corrects secondary address information for U.S. business addresses whose secondary address information could not be validated. If Suite^{Link} processing is enabled, the firm name is matched to a database of known firm names and their secondary address information.</p> <p data-bbox="553 552 695 579">For example,</p> <p data-bbox="553 600 971 716">Firm Name: Pitney Bowes Address Line 1: 4200 Parliament Place Address Line 2: STE 1 Postal Code: 20706</p> <p data-bbox="553 737 1325 764">In this case, Suite^{Link} processing would provide the correct suite number:</p> <p data-bbox="553 785 932 900">Firm Name: Pitney Bowes Address Line 1: 4200 Parliament PI Address Line 2: STE 500 Postal Code: 20706-1844</p> <p data-bbox="553 921 1425 949">To perform Suite^{Link™} processing, you must have the Suite^{Link™} database installed.</p> <p data-bbox="553 970 1032 997">This option takes one of the following values:</p> <p data-bbox="553 1018 1081 1094">N No, do not use Suite^{Link™}. Default. Y Yes, use Suite^{Link™} processing.</p> <p data-bbox="553 1115 1409 1142">For a listing of fields returned by this option, see SuiteLink Output on page 690.</p>

optionName	Description
OutputPreferredAlias	<p data-bbox="553 373 1224 401">Specifies whether to use a street's preferred alias in the output.</p> <p data-bbox="553 420 1429 478">Street name aliases in the United States are alternative names given to sections of a street. There are four types of street name aliases:</p> <ul data-bbox="553 497 1429 835" style="list-style-type: none"> <li data-bbox="553 497 1429 556">• Preferred—A preferred alias is the street name preferred locally. It typically applies only to a specific range of addresses on the street. <li data-bbox="553 562 1429 678">• Abbreviated—An abbreviated alias is a variation of the street name that can be used in cases where the length of AddressLine1 is longer than 31 characters. For example, the street name 1234 BERKSHIRE VALLEY RD APT 312A could be abbreviated to 1234 BERKSHIRE VLLY RD APT 312A. <li data-bbox="553 684 1429 772">• Changed—There has been an official street name change and the alias reflects the new name. For example if SHINGLE BROOK RD is changed to CANNING DR, then CANNING DR would be a changed alias type. <li data-bbox="553 779 1429 835">• Other—The street alias is made up of other names for the street or common abbreviations of the street. <p data-bbox="553 854 1317 882">The non-alias version of the street name is called the base street name.</p> <p data-bbox="553 900 1409 959">If the preferred alias is used in the input then the preferred alias will be the street name in the output regardless of whether you enable this option.</p> <p data-bbox="553 978 1422 1037">This is one of three options that control how ValidateAddress handles street name aliases. The other two are OutputStreetNameAlias and OutputAbbreviatedAlias.</p> <p data-bbox="553 1056 1429 1199">In most cases, if you select both OutputPreferredAlias and OutputAbbreviatedAlias, and ValidateAddress finds both a preferred and an abbreviated alias in the postal database, the abbreviated alias will be used in the output. The exception to this rule is if the input street name is a preferred alias. In this case, the preferred alias will be used in the output.</p> <p data-bbox="553 1213 1122 1241">Y Yes, perform preferred alias processing.</p> <p data-bbox="553 1260 1276 1287">N No, do not perform preferred alias processing. Default.</p> <p data-bbox="639 1314 1422 1400">Note: If the input address contains a street name alias of type "changed" the output address will always contain the base street name regardless of the options you specify.</p>

optionName	Description
OutputAbbreviatedAlias	<p>Specifies whether to use a street's abbreviated alias in the output if the output address line is longer than 31 characters.</p> <p>This is one of three options that control how ValidateAddress handles street name aliases. The other two are OutputStreetNameAlias and OutputPreferredAlias.</p> <p>Note: If a preferred alias is specified in the input, the output street name will always be the preferred alias, even if you enable abbreviated street name alias processing.</p> <p>Y Yes, perform abbreviated alias processing.</p> <p>N No, do not perform abbreviated alias processing. Default.</p> <p>Note: If the input address contains a street name alias of type "changed" the output address will always contain the base street name regardless of the options you specify.</p>
DPVDetermineNoStat	<p>Determines the "no stat" status of an address. An address is considered "no stat" if it exists but cannot receive mail, and therefore is not counted as a delivery statistic on a carrier's route (hence the term "no stat"). Examples include buildings under construction or those that the letter carrier has identified as not likely to receive mail.</p> <p>N No, do not determine "no stat" status. Default.</p> <p>Y Yes, determine "no stat" status.</p> <p>Note: You must enable DPV processing to use this option.</p> <p>The result is returned in the DPVNoStat field. For more information see LACSLink Output on page 686</p>
DPVDetermineVacancy	<p>Determines if the location has been unoccupied for at least 90 days.</p> <p>N No, do not determine vacancy. Default.</p> <p>Y Yes, determine vacancy.</p> <p>Note: You must enable DPV processing to use this option.</p> <p>The result is returned in the DPVVacant field. For more information see LACSLink Output on page 686</p>
ReturnVerimove	<p>Returns VeriMove detail data in output.</p> <p>N No, do not return VeriMove detail data. Default.</p> <p>Y Yes, return VeriMove detail data.</p>

optionName	Description
SuppressZplusPhantomCarrierR777	<p>Specifies whether to suppress addresses with Carrier Route R777. These addresses are phantom routes and are not eligible for street delivery. Since these addresses are assigned a ZIP + 4[®] code by the USPS[®], Validate Address marks these addresses as deliverable. Select this option if you do not want addresses with Carrier Route R777 marked as deliverable. This will cause the following actions:</p> <ul style="list-style-type: none"> • No ZIP + 4 code is assigned • Address is not counted on the USPS Form 3553 (CASS Summary Report) • DPV Footnote of R7 is returned <p>N No, do not suppress addresses with Carrier Route R777.</p> <p>Y Yes, suppress addresses with Carrier Route R777.</p>
StreetMatchingStrictness	<p>Specifies the algorithm to use when determining if an input address matches an address in the postal database. One of the following:</p> <p>E The input street name must match the database exactly.</p> <p>T The matching algorithm is "tight."</p> <p>M The matching algorithm is "medium" (default).</p> <p>L The matching algorithm is "loose."</p>
FirmMatchingStrictness	<p>Specifies the algorithm to use when determining if an input address matches an address in the postal database. One of the following:</p> <p>E The input firm name must match the database exactly.</p> <p>T The matching algorithm is "tight."</p> <p>M The matching algorithm is "medium" (default).</p> <p>L The matching algorithm is "loose."</p>
DirectionalMatchingStrictness	<p>Specifies the algorithm to use when determining if an input address matches an address in the postal database. One of the following:</p> <p>E The input directionals, such as the "N" in 123 N Main St., must match the database exactly.</p> <p>T The matching algorithm is "tight."</p> <p>M The matching algorithm is "medium". Default.</p> <p>L The matching algorithm is "loose."</p>

optionName	Description
DPVSuccessfulStatusCondition	<p>Select the match condition where a DPV result does NOT cause a record to fail.</p> <p>F Full match</p> <p>P Partial match</p> <p>A Always. Default.</p> <p>Note: You must enable DPV processing to use this option.</p>
FailOnCMRAMatch	<p>Treat Commercial Mail Receiving Agency (CMRA) matches as failures?</p> <p>N No, do not treat CMRA matches as failures. Default.</p> <p>Y Yes, treat CMRA matches as failures.</p> <p>Note: You must enable DPV processing to use this option.</p>
StandardAddressPMBLine	<p>Specifies where Private Mailbox (PMB) information is placed.</p> <p>N None. Do not include the PMB information in Standard Address output (default).</p> <p>1 Place the PMB information in AddressLine1. If you specify 1, you must set StandardAddressFormat to either C or D.</p> <p>2 Place the PMB information in AddressLine2.</p>
PreferredCity	<p>Specifies whether the preferred last line city name should be stored.</p> <p>Z Store the Preferred Last Line City Name from the USPS ZIP+4 File (Override City Name).</p> <p>Note: If you select this option, Validate Address generates a CASS-certified configuration and the USPS 3553 Report.</p> <p>C Store the USPS-preferred City Name from USPS City/State File.</p> <p>Note: If you select this option, Validate Address does not generate a CASS-certified configuration and does not generate the USPS 3553 Report.</p> <p>P Store the Primary City Name from the USPS City/State File.</p> <p>Note: If you select this option, Validate Address does not generate a CASS-certified configuration and does not generate the USPS 3553 Report.</p>

CASS Certified Processing

CASS Certified™ processing also generates the USPS CASS Detailed Report, which contains some of the same information as the 3553 report but provides much greater detail about DPV, LACS, and SuiteLink statistics. The USPS CASS Detailed Report is not required for postal discounts and does not need to be submitted with your mailing.

1. Validate Address must be in CASS Certified™ mode. If **(Not CASS Certified)** appears at the top of the window, click the **Enable CASS** button. The **Enforce CASS rules** check box will appear.
2. Click **Configure CASS 3553**. The **CASS Report Fields** dialog box appears.
3. Type the **List Processor** company name, **List Name or ID#**, and the **Number of Lists** being processed for this job.
4. Type the **Mailer Name, Address, and City, State, ZIP**.
5. Click **OK**.

The List information will appear in Section B and the Mailer information in Section D of the generated USPS® CASS Form 3553.

6. In Enterprise Designer, drag **CASS3553** from the Reports pallet to the canvas.
7. Double-click the **CASS3553** icon on the canvas.
8. On the **Stages** tab, check the **Validate Address** check box. Note that if you have renamed the Validate Address stage to something else, you should check the box with the name you have given the address validation stage.
9. On the **Parameters** tab, select the format for the report. You can create the report in PDF, HTML, or plain text format.
10. Click **OK**.
11. Repeat steps 6-10 for **CASSDetail** if you want to produce the CASS Detail Report.

Canadian Address Options

optionName	Description
PerformCanadianProcessing	<p>Specifies whether to process Canadian addresses. If you enable Canadian address processing ValidateAddress will attempt to validate Canadian addresses. If you disable Canadian address processing, Canadian addresses will fail, meaning they is returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for Canadian address processing you must disable Canadian address processing in order for your jobs to complete successfully, regardless of whether or not they contain Canadian addresses.</p> <p>Note: You must have a valid license for Canadian address processing to successfully process Canadian addresses. If you enable Canadian address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p>N No, do not process Canadian addresses.</p> <p>Y Yes, process Canadian addresses (default).</p>
Database.Canada	<p>Specifies which database you want to use for validating Canadian addresses. To specify a database for Canadian address validation, select a database in the Database drop-down list. Only databases that have been defined in the CAN Database Resources panel in the Management Console are available.</p>

optionName	Description
CanFrenchFormat	<p>Specifies how to determine the language (English or French) to use to format the address and directional. The following example shows an address formatted in English and French:</p> <p>English: 123 Main St W French: 123 Rue Main O</p> <p>The parameter controls the formatting of the address. It also affects the spelling of the directional but not spelling of the suffix.</p> <ul style="list-style-type: none"> C Use the street suffix returned by the matching process to determine the language. The street suffix returned by the matching process, which is used internally by <code>ValidateAddress</code> during processing, may be different from that in the input address. Ambiguous records are formatted like the input. Default. All addresses in Quebec are formatted using French. S Use the Canadian database to determine the language. The Canadian database contains data from the Canada Post Corporation (CPC). All addresses in Quebec are formatted using French. T Use the <code>CanLanguage</code> input field to determine the language. If there is a non-blank value in this field the address are formatted using French.
CanEnglishApartmentLabel	<p>For English addresses, specifies the default apartment label to use in the output if there is no apartment label in the input address. This setting is ignored if you specify <code>CanStandardAddressFormat=F</code>.</p> <ul style="list-style-type: none"> Apt Use "Apt" as the label. Default. Apartment Use "Apartment" as the label. Suite Use "Suite" as the label. Unit Use "Unit" as the label.

optionName	Description
CanFrenchApartmentLabel	<p>For French addresses, specifies the default apartment label to use in the output if there is no apartment label in the input address. This setting is ignored if you specify <code>CanStandardAddressFormat=F</code>.</p> <p>App Use "App" as the label. Default.</p> <p>Appartement Use "Appartement" as the label.</p> <p>Bureau Use "Bureau" as the label.</p> <p>Suite Use "Suite" as the label.</p> <p>Unite Use "Unite" as the label.</p>
ForceCorrectionLVR	<p>Changes the civic and/or suite information to match the Large Volume Receiver (LVR) or single-single record (used when there is only one record for that postal code/street name/street type).</p> <p>N Do not change the civic and/or suite information to match the LVR or single-single record. The LVR record will be marked as a valid but non-correctable record (VN). The single-single record will be corrected, if possible, or processed as a non-correctable record..</p> <p>Y Change the civic and/or suite information to match the LVR or single-single record.</p> <p>Note: If you check this box, the Statement of Address Accuracy will not be printed because this is not a SERP-recognized setting.</p>
CanPreferHouseNum	<p>In cases where the house number and postal code are both valid but in conflict, you can force the postal code to be corrected based on the house number by specifying <code>CanPreferHouseNum=Y</code>. If you do not select this option the house number is changed to match the postal code.</p> <p>N Change the house number to match the postal code. Default.</p> <p>Y Change the postal code to match the house number.</p>

optionName	Description
CanOutputCityAlias	<p data-bbox="808 373 1412 470">Specifies whether or not to return the city alias when the alias is in the input address. This option is disabled when you specify <code>CanOutputCityFormat=D</code>.</p> <p data-bbox="808 483 1412 546">Y Output the city alias when the city alias is in the input. Default.</p> <p data-bbox="808 558 1412 596">N Never output the city alias even if it is in the input.</p>
CanNonCivicFormat	<p data-bbox="808 680 1425 743">Specifies whether or not non-civic keywords are abbreviated in the output. For example, Post Office Box vs. PO Box.</p> <p data-bbox="808 756 1425 793">A Abbreviate non-civic keywords. Default.</p> <p data-bbox="808 806 1425 865">F Do not abbreviate non-civic keywords. The full keyword is used.</p>
EnableSERP	<p data-bbox="808 949 1331 982">Specifies whether or not to use SERP options.</p> <p data-bbox="808 995 1331 1033">Y Enable SERP options.</p> <p data-bbox="808 1045 1331 1075">N Do not enable SERP options. Default.</p>
CanStandardAddressFormat	<p data-bbox="808 1159 1425 1276">Specifies where to place secondary address information in the output address. Secondary address information refers to apartment numbers, suite numbers, and similar designators.</p> <p data-bbox="808 1289 1425 1352">D Place apartment information in the location specified in the <code>StandardAddressFormat</code> option. Default.</p> <p data-bbox="808 1365 1425 1428">B Place apartment information at the at the end (back) of the <code>AddressLine1</code> field.</p> <p data-bbox="808 1440 1425 1537">F Place the apartment number only (no label) at the beginning of the <code>AddressLine1</code> field. For example, 400-123 Rue Main</p> <p data-bbox="808 1549 1425 1646">E Place the apartment number and label at the beginning of the <code>AddressLine1</code> field. For example, Apt 400 123 Rue Main</p> <p data-bbox="808 1659 1425 1696">S Place apartment information on a separate line.</p> <p data-bbox="808 1709 1425 1789">S Place apartment information in the same location as the input address.</p>

optionName	Description
CanOutputCityFormat	<p>Specifies whether to use the long, medium, or short version of the city if the city has a long name. For example,</p> <p>Long: BUFFALO HEAD PRAIRIE Medium: BUFFALO-HEAD-PR Short: BUFFALO-HD-PR</p> <p>D Use the default option specified by the <code>OutputShortCityName</code> option. Default. If you specify <code>OutputShortCityName=V</code>, the city is formatted as if you select <code>L</code> for this option (see below) and <code>Y</code> for CanOutputCityAlias.</p> <p>S Output short city name.</p> <p>L Output the long city name.</p> <p>M Output the medium city name.</p> <p>I Use the same city format as used in the input address. Output is L, M, or S.</p>
CanRuralRouteFormat	<p>Specifies where to place rural route delivery information. An example of an address with rural route delivery information is:</p> <p>36 GRANT RD RR 3 ANTIGONISH NS</p> <p>In this address, "RR 3" is the rural route delivery information.</p> <p>A Place rural route delivery information on the same line as the address, after the address information. Default. For example,</p> <p>36 GRANT RD RR 3</p> <p>S Place rural route delivery information on a separate address line. For example,</p> <p>36 GRANT RD RR 3</p>

optionName	Description
CanDeliveryOfficeFormat	<p data-bbox="808 373 1414 436">Specifies where to place station information. An example of an address with station information is:</p> <p data-bbox="808 457 1040 520">PO BOX 8625 STN A ST. JOHN'S NL</p> <ul data-bbox="808 541 1414 898" style="list-style-type: none"><li data-bbox="808 541 1414 604">I Place station information in the same location as it is in the input address. Default.<li data-bbox="808 625 1414 730">A Place station information on the same line as the address, after the address information. For example, PO BOX 8625 STN A<li data-bbox="808 751 1414 898">S Place station information on a separate address line. For example, PO BOX 8625 STN A

optionName	Description
CanDualAddressLogic	<p>Specifies whether ValidateAddress should return a street match or a PO Box/non-civic match when the address contains both civic and non-civic information. One of the following:</p> <ul style="list-style-type: none"> D Use DualAddressLogic Global Option. Default. P Match to PO Box or other non-street data. S Match to street. <p>For example, given the following input address:</p> <p>AddressLine1: 36 GRANT RD AddressLine2: RR 4 City: ANTIGONISH StateProvince: NS</p> <p>ValidateAddress would return one of the following:</p> <ul style="list-style-type: none"> • If CanDualAddressLogic is set to S, ValidateAddress returns the following: <p>AddressLine1: 36 GRANT RD AddressLine2: RR 3 City: ANTIGONISH StateProvince: NS PostalCode: B2G 2L1</p> • If CanDualAddressLogic is set to P, ValidateAddress returns the following: <p>AddressLine1: RR 4 City: ANTIGONISH StateProvince: NS PostalCode: B2G 2L2</p> <p>The address data that is not used to standardize the address is returned in the AdditionalInputData field. For more information, see Output Data Options on page 619.</p>

SERP Processing

1. Validate Address must be in SERP Certified™ mode. If **(Not SERP Certified)** appears at the top of the window, click the **Enable SERP settings** button. The **Configure SERP** box will appear.
2. Click **Configure SERP**. The **SERP Report Fields** dialog box appears.
3. Type your merchant **CPC number**.
4. Type the mailer **Name, Address, and City, State, ZIP**.
5. Click **OK**.

6. In Enterprise Designer, drag **SERPReport** from the Reports pallet to the canvas.
7. Double-click the **SERPReport** icon on the canvas.
8. On the **Stages** tab, ensure that the **Validate Address** check box is checked. Note that if you have renamed the Validate Address stage to something else, you should check the box with the name you have given the address validation stage.
9. On the **Parameters** tab, select the format for the report. You can create the report in PDF, HTML, or plain text format. PDF format is the default.
10. Click **OK**.

Obtaining SERP Return Codes

SERP return codes indicate the quality of the input address as determined by the Canada Post's Software Evaluation and Recognition Program regulations.

To obtain SERP return codes, specify OutputRecordType=P. For more information on OutputRecordType, see [Output Data Options](#) on page 619.

SERP return codes are provided in the following output field.

Table 106: SERP Return Code Output

columnName	Description
CanadianSERPCode	<p>Validation/correction return code (Canadian addresses only):</p> <p>V The input was valid. Canada Post defines a "valid" address as an address that meets all the following requirements:</p> <p style="padding-left: 40px;">Note: There are exceptions. For further information, contact the CPC.</p> <ul style="list-style-type: none"> • The address must contain all required components as found in CPC's Postal Code Data Files. • The address must provide an exact match on all components for only one address in CPC's Postal Code Data Files, allowing for acceptable alternate words and names listed in the CPC Postal Code Data Files. • Address components must be in a form that allows recognition without ambiguity. Certain components may require "qualifiers" to identify them. For instance, a Route Service address requires the key words "Rural Route" or "RR" for differentiation from a "Suburban Service" or "SS" address with the same number. <p>I The input was invalid. An "invalid" address is one that does not meet CPC requirements for a valid address (see above). Examples of this include address components that are missing, invalid, or inconsistent.</p> <p>C The input was correctable. A "correctable" address is one that can be corrected to match one, and only one, address.</p> <p>N The input was non-correctable. A "non-correctable" address is one that could be corrected a number of different ways such that ValidateAddress cannot identify a single correct version.</p> <p>F The input address was foreign (outside of Canada).</p>

International Address Options

Addresses outside of the U.S. and Canada are referred to as "international" addresses. The following options control international address processing:

optionName	Description
PerformInternationalProcessing	<p data-bbox="808 373 1425 730">Specifies whether to process international addresses (addresses outside the U.S. and Canada). If you enable international address processing ValidateAddress will attempt to validate international addresses. If you disable international address processing, international addresses will fail, meaning they is returned with an "F" in the Status output field. The output field Status.Code will say "DisabledCoder." If you are not licensed for international address processing you must disable international address processing in order for your jobs to complete successfully, regardless of whether or not they contain international addresses.</p> <p data-bbox="889 747 1403 926">Note: You must have a valid license for international address processing to successfully process international addresses. If you enable international address processing but are not licensed for this feature, or your license has expired, you will receive an error.</p> <p data-bbox="813 953 1373 982">N No, do not process international addresses.</p> <p data-bbox="813 1003 1403 1031">Y Yes, process international addresses (default).</p>
Database.International	<p data-bbox="808 1119 1414 1297">Specifies which database you want to use for validating international addresses. To specify a database for international address validation, select a database in the Database drop-down list. Only databases that have been defined in the INTL Database Resources panel in the Management Console are available.</p>

optionName	Description
InternationalCityStreetSearching	<p>By default, ValidateAddress provides a balance of good address matching accuracy with good performance. If you are willing to trade matching accuracy for faster performance, use the InternationalCityStreetSearching option to increase processing speed. When you do this, some accuracy is lost. This option only controls performance for addresses outside the U.S. and Canada. This setting affects a small percentage of records, mostly addresses in the U.K. There is no performance control for U.S. and Canadian address processing.</p> <p>If you use GetCandidateAddresses, the candidate addresses returned by GetCandidateAddresses may differ from the multiple matches returned by ValidateAddress if you set the performance tuning option for international addresses to any value other than 100.</p> <p>To control performance, specify a value from 0 to 100. A setting of 100 maximizes accuracy while a setting of 0 maximizes speed. The default is 100.</p>
AddressLineSearchOnFail	<p>This option enables ValidateAddress to search the AddressLine input fields for the city, state/province, postal code, and country when the address cannot be matched using the values in the City, StateProvince, and PostalCode input fields.</p> <p>Consider enabling this option if your input addresses have the city, state/province, and postal code information in the AddressLine fields.</p> <p>Consider disabling this option if your input addresses use the City, State/Province and PostalCode fields. If you enable this option and these fields are used, there is an increased possibility that ValidateAddress will fail to correct values in these fields (for example a misspelled city name).</p> <p>N No, do not search the AddressLine fields.</p> <p>Y Yes, search the address line fields. Default.</p>

Output

The output from ValidateAddress contains different information depending on the output categories you select.

Standard Address Output

Standard address output consists of four lines of the address which correspond to how the address would appear on an address label. City, state/province, postal code, and other data is also included in standard address output. Standard address output is returned for validated addresses if you set `OutputRecordType=A`. Standard address fields are always returned for addresses that could not be validated. For non-validated addresses, the standard address output fields contain the address as it appeared in the input ("pass through" data). If you want addresses to be standardized according to postal authority standards when validation fails, specify `OutputFormattedOnFail=Y` in your request.

Table 107: Standard Address Output

columnName	Description
AdditionalInputData	Input data not used by the address validation process. For more information, see About Additional Input Data .
AddressLine1	If the address was validated, the first line of the validated and standardized address. If the address could not be validated, the first line of the input address without any changes.
AddressLine2	If the address was validated, the second line of the validated and standardized address. If the address could not be validated, the second line of the input address without any changes.
AddressLine3	If the address was validated, the third line of the validated and standardized address. If the address could not be validated, the third line of the input address without any changes.
AddressLine4	If the address was validated, the fourth line of the validated and standardized address. If the address could not be validated, the fourth line of the input address without any changes.
AddressLine5	For U.K. addresses only. If the address was validated, the fifth line of the validated and standardized address. If the address could not be validated, the fifth line of the input address without any changes.
City	The validated city name.

columnName	Description
Country	The country in the format determined by what you selected in OutputCountryFormat: <ul style="list-style-type: none"> • ISO Code • UPU Code • English • French • German • Spanish
DepartmentName	For U.K. addresses only, a subdivision of a firm. For example, Engineering Department.
FirmName	The validated firm or company name.
PostalCode	The validated ZIP Code™ or postal code.
PostalCode.AddOn	The 4-digit add-on part of the ZIP Code™. For example, in the ZIP Code™ 60655-1844, 1844 is the 4-digit add-on. (U.S. addresses only.)
PostalCode.Base	The 5-digit ZIP Code™; for example 20706 (U.S. addresses only).
StateProvince	The validated state or province abbreviation.
USUrbanName	The validated urbanization name. (U.S. addresses only.) This is used primarily for Puerto Rico addresses.

Parsed Address Elements Output

Output addresses are formatted in the parsed address format if you set `OutputRecordType=E`. If you want formatted data in the Parsed Address format to be returned when validation fails (that is, a normalized address), specify `OutputFormattedOnFail=Y`.

Note: If you always want parsed input data returned regardless of whether or not validation is successful, specify `OutputRecordType=I`. For more information, see [Parsed Input](#) on page 734.

Table 108: Parsed Address Output

columnName	Description
AdditionalInputData	Input data not used by ValidateAddress. For more information, see Additional Input Data on page 691.
AdditionalInputData.Base	Input data that was not output to the standardized address by ValidateAddress. For more information, see Additional Input Data on page 691.
AdditionalInputData.Unmatched	Input data passed to the matcher but not used by ValidateAddress for validation. For more information, see Additional Input Data on page 691.
ApartmentLabel	Apartment designator (such as STE or APT), for example: 123 E Main St APT 3
ApartmentLabel2	Secondary apartment designator, for example: 123 E Main St APT 3, 4th Floor Note: In this release, this field will always be blank.
ApartmentNumber	Apartment number. For example: 123 E Main St APT 3
ApartmentNumber2	Secondary apartment number. For example: 123 E Main St APT 3, 4th Floor Note: In this release, this field will always be blank.
CanadianDeliveryInstallationAreaName	Delivery installation name (Canadian addresses only)
CanadianDeliveryInstallationQualifierName	Delivery installation qualifier (Canadian addresses only)
CanadianDeliveryInstallationType	Delivery installation type (Canadian addresses only)

columnName	Description
City	Validated city name
Country	Country. Format is determined by what you selected in <code>OutputCountryFormat</code> : <ul style="list-style-type: none">• ISO Code• UPU Code• English• French• German• Spanish
DepartmentName	For U.K. addresses only, a subdivision of a firm. For example, Engineering Department.
FirmName	The validated firm or company name
HouseNumber	House number, for example: 123 E Main St Apt 3
LeadingDirectional	Leading directional, for example: 123 E Main St Apt 3
POBox	Post office box number. If the address is a rural route address, the rural route box number will appear here.
PostalCode	Validated postal code. For U.S. addresses, this is the ZIP Code.
PrivateMailbox	Private mailbox indicator.

columnName	Description
PrivateMailbox.Type	<p>The type of private mailbox. Possible values include:</p> <ul style="list-style-type: none"> • Standard • Non-Standard <p>Note: This replaces PrivateMailboxType (no period in field name). Please modify your API calls accordingly.</p>
RRHC	Rural Route/Highway Contract indicator
StateProvince	Validated state or province name
StreetName	Street name, for example: 123 E Main St Apt 3
StreetSuffix	Street suffix, for example: 123 E Main St Apt 3
TrailingDirectional	Trailing directional, for example: 123 Pennsylvania Ave NW
USUrbanName	USPS® urbanization name. Puerto Rican addresses only.

Parsed Input

The output can include the input address in parsed form. This type of output is referred to as "parsed input." Parsed input fields contain the address data that was used as input regardless of whether or not ValidateAddress validated the address. Parsed input is different from the "parsed address elements" output in that parsed address elements contain the validated address if the address could be validated, and, optionally, the input address if the address could not be validated. Parsed input always contains the input address regardless of whether or not ValidateAddress validated the address.

To include parsed input fields in the output, set `OutputRecordType=I`.

Table 109: Parsed Input

columnName	Description
ApartmentLabel.Input	Apartment designator (such as STE or APT), for example: 123 E Main St APT 3
ApartmentNumber.Input	Apartment number, for example: 123 E Main St APT 3
CanadianDeliveryInstallationAreaName.Input	Delivery installation name (Canadian addresses only)
CanadianDeliveryInstallationQualifierName.Input	Delivery installation qualifier (Canadian addresses only)
CanadianDeliveryInstallationType.Input	Delivery installation type (Canadian addresses only)
City.Input	Validated city name
Country.Input	Country. Format is determined by what you selected in OutputCountryFormat: <ul style="list-style-type: none"> • ISO Code • UPU Code • English • French • German • Spanish
FirmName.Input	The validated firm or company name
HouseNumber.Input	House number, for example: 123 E Main St Apt 3
LeadingDirectional.Input	Leading directional, for example: 123 E Main St Apt 3
POBox.Input	Post office box number. If the address is a rural route address, the rural route box number will appear here.

columnName	Description
PostalCode.Input	Validated postal code. For U.S. addresses, this is the ZIP Code.
PrivateMailbox.Input	Private mailbox indicator
PrivateMailbox.Type.Input	The type of private mailbox. Possible values include: <ul style="list-style-type: none"> • Standard • Non-Standard
RRHC.Input	Rural Route/Highway Contract indicator
StateProvince.Input	Validated state or province name
StreetName.Input	Street name, for example: 123 E Main St Apt 3
StreetSuffix.Input	Street suffix, for example: 123 E Main St Apt 3
TrailingDirectional.Input	Trailing directional, for example: 123 Pennsylvania Ave NW
USUrbanName.Input	USPS® urbanization name

Postal Data Output

If `OutputRecordType` contains P then the following fields are returned in the output.

Table 110: Postal Data Output

columnName	Description
CanadianSERPCode	Validation/correction return code (Canadian addresses only). For more information, see Obtaining SERP Return Codes on page 654.

columnName	Description
IntHexaviaCode	For addresses in France only, a numeric code that represents the street. For information about Hexavia codes, see www.laposte.fr .
IntINSEECODE	For addresses in France only, a numeric code that represents the city. For a listing of INSEE codes, see www.insee.fr .
PostalBarCode	The two-digit delivery point portion of the delivery point barcode (U.S. addresses only). For more information, see Creating Delivery Point Barcodes on page 627.
USAItAddr	Indicates whether or not alternate address matching logic was used, and if so which logic was used (U.S. addresses only). One of the following: <ul style="list-style-type: none"> null No alternate address scheme used. D Delivery point alternate logic was used. E Enhanced highrise alternate match logic was used. S Small town default logic was used. U Unique ZIP Code logic was used.
USBCCheckDigit	Check-digit portion of the 11-digit delivery point barcode (U.S. addresses only). For more information, see Creating Delivery Point Barcodes on page 627.
USCarrierRouteCode	Carrier route code (U.S. addresses only). For more information, see Obtaining Carrier Route Codes on page 626.
USCongressionalDistrict	Congressional district (U.S. addresses only). For more information, see Obtaining Congressional Districts on page 625.
USCountyName	County name (U.S. addresses only). For more information, see Obtaining County Names on page 626.
USFinanceNumber	The finance number in which the address resides (U.S. addresses only). The finance number is a number assigned by the USPS to an area that covers multiple ZIP Codes. An address is validated only if its finance number matches the finance number of the candidate address in the U.S. Database.

columnName	Description
USFIPSCountyNumber	FIPS (Federal Information Processing Standards) county number (U.S. addresses only). For more information, see Obtaining FIPS County Numbers on page 626.
USLACS	<p>Indicates whether or not the address is a candidate for LACS^{Link} conversion (U.S. addresses only). One of the following:</p> <p>Y Yes, the address is a candidate for LACS^{Link} processing. If LACS^{Link} is enabled, an attempt is made to convert the address using the LACS^{Link} database. If the conversion attempt is successful, the output address is the new address obtained from the LACS^{Link} database. If the attempt is not successful, the address will not be converted.</p> <p>N No, the address is not a candidate for LACS^{Link} processing. LACS^{Link} processing may still be attempted if LACS^{Link} processing is requested, the LACS^{Link} database is installed, and one of the following is true:</p> <ul style="list-style-type: none"> • The address matches to a Rural Route address and the RecordType.Default field returns a Y. • The input address could not be matched to any address in the U.S. Postal Database (Failures due to multiple matches are not LACS^{Link} candidates.)
USLastLineNumber	<p>A six-character alphanumeric value that groups together ZIP Codes that share the same primary city. For example, addresses with the following two last lines would have the same last line number:</p> <p>Chantilly VA 20151 Chantilly VA 20152</p>

Result Indicators

Result indicators provide information about the kinds of processing performed on an address. There are two types of result indicators:

Record-Level Result Indicators

Record-level result indicators provide data about the results of ValidateAddress processing for each record, such as the success or failure of the match attempt, which coder processed the address, and other details. The following table lists the record-level result indicators returned by ValidateAddress.

Table 111: Record Level Indicators

columnName	Description
AddressFormat	<p>The type of address data being returned:</p> <ul style="list-style-type: none"> F French format (for example: 123 Rue Main) E English format (for example: 123 Main St)
Confidence	<p>The level of confidence assigned to the address being returned. Range is from zero (0) to 100; zero indicates failure, 100 indicates a very high level of confidence that the match results are correct. For multiple matches, the confidence level is 0. For details about how this number is calculated, see Introduction to the Validate Address Confidence Algorithm on page 755.</p>
CouldNotValidate	<p>If no match was found, which address component could not be validated:</p> <ul style="list-style-type: none"> • ApartmentNumber • HouseNumber • StreetName • PostalCode • City • Directional • StreetSuffix • Firm • POBoxNumber • RuralRoute <p>Note: More than one component may be returned, in a comma-separated list.</p>

columnName	Description
CountryLevel	<p>The category of address matching available. This is always "A" for U.S. and Canadian addresses. One of the following:</p> <p>A The address is in a country for which there is highly detailed postal data available. Addresses in this match level can have the following address elements validated and corrected, and added if missing from the input:</p> <ul style="list-style-type: none">• Postal code• City name• State/county name• Street address elements• Country name <p>B The address is in a country for which there is a medium level of postal data available. Addresses in this match level can have the following address elements validated and corrected, and added if missing from the input:</p> <ul style="list-style-type: none">• Postal code• City name• State/county name• Country name <p>C The address is in a country for which the postal data is least detailed. Addresses in this match level can have the following actions performed on them:</p> <ul style="list-style-type: none">• Validate and correct country name (cannot supply missing country name)• Validate the format of the postal code (cannot supply missing postal code or validate the code)

columnName	Description
MatchScore	<p>MatchScore provides an indication of the degree to which the output address is correct. It is significantly different from Confidence in that Confidence indicates how much the input address changed to obtain a match, whereas the meaning of Match Score varies between U.S. and non-U.S. addresses.</p> <p>For U.S. addresses, MatchScore is a one-digit score on a scale of 0 to 9 that reflects the closeness of the street-name match (after transformations by ValidateAddress, if any). Zero indicates an exact match and 9 indicates the least likely match. If no match was found, this field is blank.</p> <p>For non-U.S. and non-Canadian addresses, MatchScore is a five-digit score, with a maximum value of 00999. Higher numbers indicates a closer match.</p> <p>This field does not apply to Canadian addresses.</p> <p>Note that you cannot equate match scores from U.S. addresses with those of non-U.S. addresses. For example, a match score of 4 for a U.S address does not indicate the same level of match as a 00004 for a non-U.S. address.</p> <p>Note: The Validate Address and Advanced Matching Module components both use the MatchScore field. The MatchScore field value in the output of a dataflow is determined by the last stage to modify the value before it is sent to an output stage. If you have a dataflow that contains Validate Address and Advanced Matching Module components and you want to see the MatchScore field output for each stage, use a Transformer stage to copy the MatchScore value to another field. For example, Validate Address produces an output field called MatchScore and then a Transformer stage copies the MatchScore field from Validate Address to a field called AddressMatchScore. When the matcher stage runs it populates the MatchScore field with the value from the matcher and passes through the AddressMatchScore value from Validate Address.</p>
MultimatchCount	If multiple matches were found, indicates the number of records that are possible matches.
MultipleMatches	<p>Indicates which address component had multiple matches, if multiple matches were found:</p> <ul style="list-style-type: none"> • Firm • LeadingDirectional • PostalCode • StreetName • StreetSuffix • TrailingDirectional • Urbanization <p>Note: More than one component may be returned, in a comma-separated list.</p>

columnName	Description						
ProbableCorrectness	<p>Indicates the accuracy of a match on the scale of 0 to 9. The result can be:</p> <ul style="list-style-type: none"> • <i>Blank</i> - No Match Found • 0 - Most likely to be correct (Exact Match) • 1-8 - Intermediate probability of being correct • 9 - Match least likely to be correct 						
ProcessedBy	<p>Which address coder processed the address:</p> <table> <tr> <td>USA</td> <td>U.S. address coder</td> </tr> <tr> <td>CAN</td> <td>Canadian address coder</td> </tr> <tr> <td>INT</td> <td>International address coder</td> </tr> </table>	USA	U.S. address coder	CAN	Canadian address coder	INT	International address coder
USA	U.S. address coder						
CAN	Canadian address coder						
INT	International address coder						
RecordType	<p>Type of address record, as defined by U.S. and Canadian postal authorities (supported for U.S. and Canadian addresses only):</p> <ul style="list-style-type: none"> • FirmRecord • GeneralDelivery • HighRise • PostOfficeBox • RRHighwayContract • Normal 						
RecordType.Default	<p>Code indicating the "default" match:</p> <table> <tr> <td>Y</td> <td>The address matches a default record.</td> </tr> <tr> <td>null</td> <td>The address does not match a default record.</td> </tr> </table>	Y	The address matches a default record.	null	The address does not match a default record.		
Y	The address matches a default record.						
null	The address does not match a default record.						
Status	<p>Reports the success or failure of the match attempt. For multiple matches, this field is "F" for all the possible matches.</p> <table> <tr> <td>null</td> <td>Success</td> </tr> <tr> <td>F</td> <td>Failure</td> </tr> </table>	null	Success	F	Failure		
null	Success						
F	Failure						

columnName	Description
Status.Code	Reason for failure, if there is one. For multiple matches, all possible matches is "MultipleMatchesFound." <ul style="list-style-type: none"> • DisabledCoder • InsufficientInputData • MultipleMatchesFound • UnableToValidate
Status.Description	Description of the problem, if there is one. <p>Possible Multiple Addresses Found This value will appear if Status.Code=MultipleMatchesFound.</p> <p>Address Not Found This value will appear if Status.Code=UnableToValidate.</p> <p>PerformUSProcessing disabled This value will appear if Status.Code=DisabledCoder.</p> <p>PerformCanadianProcessing disabled This value will appear if Status.Code=DisabledCoder.</p> <p>PerformInternationalProcessing disabled This value will appear if Status.Code=DisabledCoder.</p>

Field-Level Result Indicators

Field-level result indicators describe how ValidateAddress handled each address element. Field-level result indicators are returned in the qualifier "Result". For example, the field-level result indicator for HouseNumber is contained in **HouseNumber.Result**.

To enable field-level result indicators, specify `OutputFieldLevelReturnCodes=Y`. For more information, see [Output Data Options](#) on page 619.

The following table lists the field-level result indicators. If a particular field does not apply to an address, the result indicator may be blank.

Table 112: Field-Level Result Indicators

columnName	Description
AddressRecord.Result	<p>These result codes apply to international addresses only.</p> <ul style="list-style-type: none"> M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. S Standardized. This option includes any standard abbreviations. U Unmatched. V Validated. The data was confirmed correct and remained unchanged from input.
ApartmentLabel.Result	<ul style="list-style-type: none"> A Appended. The field was added to a blank input field. U.S. and Canadian addresses only. C Corrected. U.S. and Canadian addresses only. D Dropped. The field provided on input was removed. U.S. and Canadian addresses only. For more information, see About Additional Input Data. F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses. P Pass-through. The data was not used in the validation process, but it was preserved in the output. U.S. and Canadian addresses only. R The apartment label is required but is missing from the input address. U.S. addresses only. S Standardized. This option includes any standard abbreviations. U Unmatched. Does not apply to Canadian addresses. V Validated. The data was confirmed correct and remained unchanged from input.

columnName	Description
ApartmentNumber.Result	<p>A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.</p> <p>C Corrected. Canadian addresses only.</p> <p>D Dropped. The field provided on input was removed. U.S. addresses only. For more information, see About Additional Input Data.</p> <p>F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.</p> <p>P Pass-through. The data was not used in the validation process, but it was preserved in the output. U.S. addresses that are an EWS match will have a value of P. U.S. and Canadian addresses only.</p> <p>R The apartment number is required but is missing from the input address. U.S. addresses only.</p> <p>S Standardized. This option includes any standard abbreviations. Does not apply to U.S. addresses.</p> <p>U Unmatched.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>

columnName	Description
City.Result	<p>A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.</p> <p>C Corrected. U.S. and Canadian addresses only.</p> <p>F Hyphens missing or punctuation errors. Canadian addresses only.</p> <p>M Multiple. The data was confirmed correct and remained unchanged from input.</p>
Street.Result	<p>These result codes apply to international addresses only.</p> <p>M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field.</p> <p>P Pass-through. The data was not used in the validation process, but it was preserved in the output.</p> <p>R Street corrected. House number is out of range. Applies to French, UK, and Japanese records only.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>U Unmatched.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>

columnName	Description
StreetName.AbbreviatedAlias.Result	<p>Indicates the result of abbreviated alias processing. One of the following:</p> <ul style="list-style-type: none"> null No abbreviated alias processing attempted. B The StreetName field contains the base street name. L The standardized address length is less than 31 characters so the StreetName field contains the base name. N No abbreviated alias found. Y An abbreviated alias was found for input address. The StreetName field contains the abbreviated alias.
StreetName.Alias.Type	<p>This result code applies to U.S. addresses only.</p> <p>Note: In previous releases this field was named StreetName.AliasType with no "." between "Alias" and "Type." This old name is obsolete. Please update your processes to use the new name StreetName.Alias.Type.</p> <ul style="list-style-type: none"> Abbreviated The alias is an abbreviation of the street name. For example, HARTS-NM RD is an abbreviated alias for HARTSVILLE NEW MARLBORO RD. Changed There has been an official street name change and the alias reflects the new name. For example if SHINGLE BROOK RD is changed to CANNING DR, then CANNING DR would be a changed alias type. Other The street alias is made up of other names for the street or common abbreviations of the street. Preferred The street alias is the locally preferred alias. For example, a street is named "South Shore Dr." because it runs along the southern shore of a lake, not because it is south of a municipal demarcation line. So, "South" is not a predirectional in this case and should not be shorted to "S". So, "South Shore Dr." would be the preferred alias.

columnName	Description
StreetName.PreferredAlias.Result	<p>Indicates the result of preferred alias processing. One of the following:</p> <ul style="list-style-type: none"> null No preferred alias processing attempted. A Preferred alias processing was not attempted because the input address matched to an alias. Preferred alias processing is only attempted for base addresses. N No preferred alias found. Y A preferred alias was found for the input address. The StreetName field contains the preferred alias.
StreetName.Result	<ul style="list-style-type: none"> A Appended. The field was added to a blank input field. Canadian addresses only. C Corrected. U.S. and Canadian addresses only. D Dropped. The field provided on input was removed. U.S. addresses only. For more information, see About Additional Input Data. F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses. M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. U.S. addresses only. P Pass-through. The data was not used in the validation process, but it was preserved in the output. Does not apply to U.S. addresses. S Standardized. This option includes any standard abbreviations. U.S. and Canadian addresses only. U Unmatched. V Validated. The data was confirmed correct and remained unchanged from input.

columnName	Description
StreetSuffix.Result	<p>A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.</p> <p>C Corrected. U.S. and Canadian addresses only.</p> <p>D Dropped. The field provided on input was removed. U.S. and Canadian addresses only. For more information, see About Additional Input Data.</p> <p>F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.</p> <p>M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. U.S. addresses only.</p> <p>P Pass-through. The data was not used in the validation process, but it was preserved in the output. Canadian addresses only.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>U Unmatched. Does not apply to U.S. addresses.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>

columnName	Description
TrailingDirectional.Result	<p>A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.</p> <p>C Corrected. U.S. and Canadian addresses only.</p> <p>D Dropped. The field provided on input was removed. U.S. and Canadian addresses only. For more information, see About Additional Input Data.</p> <p>F Formatted. The input address matched multiple records in the postal database, and each matching record has a different value in this field.</p> <p>U Unmatched.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>

Output from Options

ValidateAddress returns additional data depending on the options you select. For information on the output generated by each option, see the options listed in the following sections:

Enhanced Line of Travel Output

Enhanced Line of Travel processing produces the following output.

columnName	Description
USLOTCode	<p>Line of Travel sequence code and an indicator denoting USPS® LOT sequence. This field is in the format nnnnY where:</p> <p>nnnn The four-digit LOT code.</p> <p>Y One of the following:</p> <ul style="list-style-type: none"> • A—Ascending LOT sequence • D—Descending LOT sequence
USLOTHex	A hexadecimal value that allows you to sort your file in ascending order only. The hexadecimal values range from 0 to FF ascending, then FF through 0 descending.
USLOTSequence	A two-byte value used for final sortation in place of the DPC add-on. It consists of an uppercase letter followed by a digit 0 through 9. Values range from A0 (99 descending) through J9 (00 descending), and K0 (00 ascending) through T9 (99 ascending).

LACS^{Link} Output

columnName	Description
USLACS	<p>Indicates whether or not the address is a candidate for LACS^{Link} conversion (U.S. addresses only). One of the following:</p> <p>Y Yes, the address is a candidate for LACS^{Link} processing. If LACS^{Link} is enabled, ValidateAddress will attempt to convert the address using the LACS^{Link} database. If the conversion attempt is successful, the output address is the new address obtained from the LACS^{Link} database. If the attempt is not successful, the address will not be converted.</p> <p>N No, the address is not a candidate for LACS^{Link} processing. LACS^{Link} processing may still be attempted if LACS^{Link} processing is requested, the LACS^{Link} database is installed, and one of the following is true:</p> <ul style="list-style-type: none"> • The address matches to a Rural Route address and the RecordType.Default field returns a Y. • The input address could not be matched to any address in the U.S. Postal Database (Failures due to multiple matches are not LACS^{Link} candidates.)
USLACS.ReturnCode	<p>Indicates the success or failure of LACS^{Link} processing. (U.S. addresses only.)</p> <p>A LACS^{Link} processing successful. Record matched through LACS^{Link} processing.</p> <p>00 LACS^{Link} processing failed. No matching record found during LACS^{Link} processing.</p> <p>09 LACS^{Link} processing matched the input address to an older highrise default address. The address has been converted. Rather than provide an imprecise address, LACS^{Link} processing does not provide a new address.</p> <p>14 LACS^{Link} processing failed. Match found during LACS^{Link} processing but conversion did not occur due to other USPS[®] regulations.</p> <p>92 LACS^{Link} processing successful. Record matched through LACS^{Link} processing. Unit number dropped on input.</p> <p>null LACS^{Link} did not process the record, or LACS^{Link} processing was not attempted.</p>

RDI Output

columnName	Description
RDI	Return values indicating address type. B The address is a business address. R The address is a residential address. M The address is both a residential and a business address. null Not checked because the address did not code at a ZIP + 4 [®] level, or RDI [™] was not performed.

DPV and CMRA Output

columnName	Description
DPV	<p>Indicates the results of Delivery Point Validation (DPV) processing.</p> <p>Y DPV confirmed. Mail can be delivered to the address.</p> <p>N Mail cannot be delivered to the address.</p> <p>S The building number was validated but the unit number could not be confirmed. A building number is the primary address number for a building. A unit number is a number of a distinct mailing address within a building such as an apartment, suite, floor, and so on. For example, in this address 424 is the building number and 12 is the unit number:</p> <p>424 Washington Blvd. Apt. 12 Oak Park IL 60302 USA</p> <p>D The building number was validated but the unit number was missing from input. A building number is the primary address number for a building. A unit number is a number of a distinct mailing address within a building such as an apartment, suite, floor, and so on. For example, in this address 424 is the building number and 12 is the unit number:</p> <p>424 Washington Blvd. Apt. 12 Oak Park IL 60302 USA</p> <p>M The address matches multiple valid delivery points.</p> <p>U The address could not be confirmed because the address did not code at the ZIP + 4[®] level.</p> <p>V The address caused a false-positive violation.</p>
CMRA	<p>Indicates if the address is a Commercial Mail Receiving Agency (CMRA)</p> <p>Y Yes, the address is a CMRA.</p> <p>N No, the address is not a CMRA.</p> <p>U Unconfirmed.</p>

columnName	Description
DPVFootnote	<p>DPV footnote codes.</p> <p>AA Input address matched to the ZIP + 4[®] file.</p> <p>A1 Input address not matched to the ZIP + 4[®] file.</p> <p>BB Input address matched to DPV (all components).</p> <p>CC Input address primary number matched to DPV but secondary number not match (present but not valid).</p> <p>F1 Input address is military; DPV bypassed.</p> <p>G1 Input address is general delivery; DPV bypassed.</p> <p>M1 Input address primary number missing.</p> <p>M3 Input address primary number invalid.</p> <p>N1 Input address primary number matched to DPV but high rise address missing secondary number.</p> <p>P1 Input address missing RR or HC Box number.</p> <p>P3 Input address missing PO, RR, or HC Box number</p> <p>RR Input address matched to CMRA.</p> <p>R1 Input address matched to CMRA but secondary number not present.</p> <p>R7 Input address matched to phantom carrier route R777 (not eligible for street delivery).</p> <p>U1 Input address is unique ZIP; DPV bypassed.</p>
DPVVacant	<p>Indicates whether the building is vacant (unoccupied for 90 days). One of the following:</p> <p>Y Yes, the building is vacant.</p> <p>N No, the building is not vacant.</p> <p>null The DPVDetermineVacancy option was not turned on.</p>
DPVNoStat	<p>Indicates whether the building is a "no stat" building and therefore unable to receive mail. One of the following:</p> <p>Y Yes, the building is a "no stat" building, which means the building is not receiving mail.</p> <p>N No, the building is not a "no stat" building, which means the building does receive mail.</p> <p>null The DPVDetermineNoStat option was not turned on.</p>

Suite^{Link} Output

columnName	Description
SuiteLinkReturnCode	<p>Indicates whether or not ValidateAddress corrected the secondary address information (U.S. addresses only). One of the following:</p> <p>A ValidateAddress corrected the secondary address information.</p> <p>00 ValidateAddress did not correct the secondary address information.</p> <p>null Suite^{Link} was not performed.</p> <p>XX Suite^{Link} processing encountered an error. For example, an error would occur if the Suite^{Link} database is expired.</p>
SuiteLinkMatchCode	<p>Provides additional information on the Suite^{Link} match attempt. (U.S. addresses only)</p> <p>A ValidateAddress corrected the secondary address information.</p> <p>B ValidateAddress did not correct the secondary address information. No additional detail about the match attempt is available.</p> <p>C The words in the FirmName field are all "noise" words. Noise words are defined by the USPS[®] and are ignored when attempting to match the firm name. Examples of noise words are "company" and "corporation". ValidateAddress is not able to correct secondary address information for firm names that consist entirely of noise words. For example "Company and Corporation" is all noise words.</p> <p>D The address is not a high-rise default address. Suite^{Link} matching is only done for high-rise default addresses. A high-rise default is a default to use when the address does not contain valid secondary information (the apartment number or apartment type is missing).</p> <p>E Suite^{Link} processing failed because the Suite^{Link} database is expired.</p> <p>null Suite^{Link} was not performed or there was an error.</p>

columnName	Description
SuiteLinkFidelity	Indicates how well ValidateAddress matched the firm name to the firm names in the Suite ^{Link} database. <ul style="list-style-type: none"> 1 The firm name matches the Suite^{Link} database exactly. 2 Good match. All words in the firm name except one matched the firm name in the Suite^{Link} database. 3 Poor match. More than one word in the firm name did not match the firm name in the Suite^{Link} database. null Suite^{Link} could not match the firm name, or was not performed, or there was an error.

VeriMove Output

columnName	Description
VeriMoveDataBlock	Indicates whether or not ValidateAddress should return a 250-byte field containing input data to pass to VeriMove Express. This field contains the Detail Results Indicator data required by VeriMove. For more information about the contents of this field, see the VeriMove User's Guide. One of the following: <ul style="list-style-type: none"> Y Yes, return the field VeriMoveDataBlock. N No, do not return the field VeriMoveDataBlock.

Additional Input Data

Some input data is ignored during the address standardization process. This extraneous data (sometimes referred to as "dropped data") is returned in the AdditionalInputData field. Some examples of dropped data include:

- Delivery instructions (for example, "Leave at back door")
- Phone numbers (for example, "555-135-8792")
- Attention lines (for example, "Attn: John Smith")

Data such as this is generally not embedded in an address. If it is embedded, the extraneous data can usually be identified and returned in the AdditionalInputData field.

Note: Dropped data from split indicia addresses is not returned. A split indicia address is one where a primary address is split between multiple address lines. For example, if the

primary address is "1 Green River Valley Rd" then the following would be a split indicia version of this address:

1 Green River
Valley Rd
01230

If there is more than one piece of dropped data in an address, each piece of data is separated by a semicolon and a space ("; ") for U.S. addresses and a space for addresses outside the U.S. The order of dropped data in `AdditionalInputData` is:

1. Care of, mail stop (U.S. addresses only)
2. Other extraneous data found on address lines
3. Entire unused data lines

For example, if this is the input address:

123 Main St C/O John Smith
Apt 5 Drop at back dock
jsmith@example.com
555-123-4567
05674

Then `AdditionalInputData` would contain:

C/O John Smith; Apt 5 Drop At Back Dock; 555-123-4567; Jsmith@example.com; 555-123-4567

Care of Data

For U.S. addresses only, "care of" data is returned in `AdditionalInputData`. The following addresses contain examples of "care of" data:

123 Main St C/O John Smith
Apt 5
05674

123 Main St
Apt 5 ATTN John Smith
05674

123 Main St Apt 5
MailStop 2
05674

Extraneous Data on Its Own Address Line

`ValidateAddress` returns extraneous data on its own address line for U.S. and Canadian addresses.

For U.S. addresses, `ValidateAddress` uses the first two non-blank address lines to perform address standardization, unless either the firm name extraction or urbanization code extraction options are enabled (see [Address Line Processing for U.S. Addresses](#) on page 619 for more information). Data on other address lines is returned in `AdditionalInputData`. In the following address, "John Smith"

would be returned in `AdditionalInputData` because it is in the third non-blank address line and `ValidateAddress` only uses the first two non-blank address lines for U.S. addresses.

```
123 Main St  
Apt 5  
John Smith  
05674
```

If one of either of the first two non-blank address lines contains extraneous data, that data is returned in `AdditionalInputData`. For example, in the following addresses "John Smith" would be returned in `AdditionalAddressData`.

```
123 Main St  
John Smith  
05674
```

```
John Smith  
123 Main St  
05674
```

In the following address both "John Smith" and "Apt 5" would both be returned in `AdditionalInputData`. "John Smith" would be returned because it is extraneous data in one of the first two address lines and "Apt 5" would be returned because U.S. address data must be in the first two non-blank address lines.

```
John Smith  
123 Main St  
Apt 5  
05674
```

Extraneous Data Within an Address Line

Extraneous data that is within an address line is returned in `AdditionalInputData`. For example, in the following addresses "John Smith" would be returned in `AdditionalInputData`.

```
123 Main St John Smith  
05674
```

```
123 Main St Apt 5 John Smith  
05674
```

```
123 Main St John Smith  
Apt 5  
05674
```

```
123 Main St  
Apt 5 John Smith  
05674
```

For U.S. addresses, only extraneous data at the end of the address line is returned in `AdditionalInputData`. Extraneous data that is not at the end of an address line is not returned for U.S. addresses. For example, in the following addresses "John Smith" is not returned.

John Smith 123 Main St
05674

123 Main John Smith St
05674

The `AdditionalInputData` column will sometimes contain the original street name or suffix if the street name was changed to obtain a match and the street name or suffix was at the end of a line. For example this address:

Pitney Bowes
4200 Parliament
Lanham MD

`ValidateAddress` would correct the spelling of the street name and add the suffix, returning "4200 Parliament Pl" as the corrected street address and "Parliament" in `AdditionalInputData`.

Dual Addresses

A dual address is an address that contains both street and PO Box/Rural Route/Highway Contract information. Depending on the processing options you select, the portion of the dual address that is not used for address standardization may be returned in `AdditionalInputData`. For more information, see [About Dual Address Logic](#) on page 632.

ValidateAddressGlobal

`ValidateAddressGlobal` provides enhanced address standardization and validation for addresses outside the U.S. and Canada. `ValidateAddressGlobal` can also validate addresses in the U.S. and Canada but its strength is validation of addresses in other countries. If you process a significant number of addresses outside the U.S. and Canada, you should consider using `ValidateAddressGlobal`.

`ValidateAddressGlobal` is part of the Universal Addressing Module.

`ValidateAddressGlobal` performs several steps to achieve a quality address, including transliteration, parsing, validation, and formatting.

Character Set Mapping and Transliteration

`ValidateAddressGlobal` handles international strings and their complexities. It uses fully Unicode enabled string processing which enables the transliteration of non-roman characters into the Latin character set and mapping between different character sets.

Character set mapping and transliteration features include:

- Support for over 30 different character sets including UTF-8, ISO 8859-1, GBK, BIG5, JIS, EBCDIC
- Proper "elimination" of diacritics according to language rules
- Transliteration for various alphabets into Latin Script
- Greek (BGN/PCGN 1962, ISO 843 - 1997)
- Cyrillic (BGN/PCGN 1947, ISO 9 - 1995)

- Hebrew
- Japanese Katakana, Hiragana and Kanji
- Chinese Pinyin (Mandarin, Cantonese)
- Korean Hangul

Address Parsing, Formatting, and Standardization

Restructuring incorrectly fielded address data is a complex and difficult task especially when done for international addresses. People introduce many ambiguities as they enter address data into computer systems. Among the problems are misplaced elements (such as company or personal names in street address fields) or varying abbreviations that are not only language, but also country specific. `ValidateAddressGlobal` identifies address elements in address lines and assigns them to the proper fields. This is an important precursor to the actual validation. Without restructuring, "no match" situations might result.

Properly identified address elements are also important when addresses have to be truncated or shortened to fit specific field length requirements. With the proper information in the right fields, specific truncation rules can be applied.

- Parses and analyzes address lines and identifies individual address elements
- Processes over 30 different character sets
- Formats addresses according to the postal rules of the country of destination
- Standardizes address elements (such as changing AVENUE to AVE)

Global Address Validation

Address validation is the correction process where properly parsed address data is compared against reference databases supplied by postal organizations or other data providers. `ValidateAddressGlobal` validates individual address elements to check for correctness using sophisticated fuzzy matching technology and produces standardized and formatted output based on postal standards and user preferences. `FastCompletion` validation type can be used in quick address entry applications. It allows input of truncated data in several address fields and generates suggestions based on this input.

In some cases, it is not possible to fully validate an address. Here `ValidateAddressGlobal` has a unique deliverability assessment feature that classifies addresses according to their probable deliverability.

Input

`ValidateAddressGlobal` takes a standard address as input. All addresses use this format no matter what country the address is from.

Table 113: ValidateAddressGlobal Input

columnName	Format	Description
AddressLine1 through AddressLine6	String [79]	<p>These fields contain address line data. AddressLine1 contains the first address line, AddressLine2 contains the second address line, and so forth. Note that the city, state/province, and postal code information should be placed in their respective fields, not address line fields. For example:</p> <p>AddressLine1: 17413 Blodgett Road AddressLine2: PO Box 123 City: Mount Vernon StateProvince: WA PostalCode: 97273 Country: USA</p> <p>If the input address is not already parsed into the appropriate address line and City, StateProvince, and PostalCode fields, use the UnformattedLine fields instead of the address line fields.</p>
City	String [79]	City name
StateProvince	String [79]	State or province.
PostalCode	String [79]:	<p>The postal code for the address. In the U.S. this is the ZIP Code®.</p> <p>99999 99999-9999 A9A9A9 A9A 9A9 9999 999</p>
Contact	String [79]	The name of the addressee. For example, "Mr. Jones".
Country	String [79]	The name of the country. If no value is specified in the <code>Input.ForceCountryISO3</code> or <code>Input.DefaultCountryISO3</code> option, you must specify a country.
FirmName	String [79]	The company or firm name.

columnName	Format	Description
Street	String [79]	Street
Number	Building [79]	Number
Building	String [79]	Building
SubBuilding	String [79]	SubBuilding
DeliveryService	String [79]	DeliveryService
UnformattedLine1 through UnformattedLine10	String [79]	<p>Use these fields if the input address is completely unparsed and you want <code>ValidateAddressGlobal</code> to attempt to parse the address into the appropriate fields. For example:</p> <p>UnformattedLine1: 17413 Blodgett Road UnformattedLine2: PO Box 123 UnformattedLine3: Mount Vernon WA 97273 UnformattedLine4: USA</p> <p>This address would be parsed into these output fields:</p> <p>AddressLine1: 17413 Blodgett Road AddressLine2: PO Box 123 City: Mount Vernon StateProvince: WA PostalCode: 97273 Country: USA</p> <p>Note: If you specify input in the unformatted line fields you must specify the entire address using only unformatted line fields. Do not use other fields such as <code>City</code> or <code>StateProvince</code> in combination with unformatted line fields.</p>

Address Guidelines for Japan

Address Guidelines for Japan

For information on Japanese addresses, see the Japan Post website: <http://www.post.japanpost.jp>.

A typical Japanese address looks like this:

北海道札幌市中央区大通西28丁目3番22号

The elements of this address are described in the following table.

Address Element	Field Name	Example
Prefecture	areaName1	北海道
City (Shi)	areaName2	札幌市中央区
Municipality Subdivision (Oaza)	areaName3	大通西
City District (Chome)	areaName4	28丁目
Block/lot number	mainAddress	3番22 Block and lot numbers are the most specific address elements in Japan. Japanese addresses typically do not have street names.

For multiline addresses in Kanji, the general pattern is to enter the postal code on the first line. On the second line, enter the other address elements starting from largest (prefecture) to smallest. The name of the recipient, business, or organization is entered on the third line. For example:

100-8994
東京都中央区八重洲一丁目5番3号
東京中央郵便局

For multiline addresses using Western conventions, the order of address elements is reversed. For example:

Tokyo Central Post Office
 5-3, Yaesu 1-Chome
 Chuo-ku, Tokyo 100-8994

Options

Input Options

Table 114: ValidateAddressGlobal Input Options

optionName	Description/Valid Values
Database.AddressGlobal	Specifies the database resource containing the postal data to use for address validation. Only databases that have been defined in the Global Database Resources panel in the Management Console are available. For more information, see the <i>Spectrum™ Technology Platform Administration Guide</i> .
Input.DefaultCountryISO3	Specifies a default country to use when the input record does not contain explicit country information. Specify the country using the ISO3 country code. If you do not specify a default country each input record must have the country specified in the Country input field. For a list of ISO codes see ISO Country Codes and Module Support on page 788.
Input.ForceCountryISO3	Causes address records to be always treated as originating from the country specified here, overriding the country in the address record and the default country. Specify the country using the ISO3 country code. For a list of ISO codes, see ISO Country Codes and Module Support on page 788.
Input.FormatDelimiter	<p>Enables you to use non-standard formatting for multiline addresses in input files. Acceptable values for this field include the following:</p> <ul style="list-style-type: none"> • CRLF (default) • LF • CR • SEMICOLON (2101 MASSACHUSETTS AVE NW ; WASHINGTON DC 20008) • COMMA (2101 MASSACHUSETTS AVE NW , WASHINGTON DC 20008) • TAB (2101 MASSACHUSETTS AVE NW WASHINGTON DC 20008) • PIPE (2101 MASSACHUSETTS AVE NW WASHINGTON DC 20008) • SPACE (2101 MASSACHUSETTS AVE NW WASHINGTON DC 20008) <p>Note: The same value must be selected for both the input option and output option.</p>

Output Options

Table 115: ValidateAddressGlobal Output Options

optionName	Description
Result.MaximumResults	This option specifies the maximum number of candidate addresses to return. This field is disabled for batch processing; for all other processing modes the default is 1 and the maximum is 99. If you are using FastCompletion mode, you may want to enter a number greater than 1 to ensure you are provided with multiple options for completing a field.
Result.IncludeInputs	<p>Specifies whether to include the input data in the output. If enabled, the output will contain fields that end with .Input containing the corresponding input field. For example, the output field AddressLine1.Input would contain the data specified in the input field AddressLine1.</p> <p>TRUE Include the input data in the output.</p> <p>FALSE Do not include the input data in the output (default).</p>
Result.StateProvinceType	<p>Specifies the format for the StateProvince field. One of the following.</p> <p>ABBREVIATION Return the abbreviation for the state or province. For example, North Carolina would be returned as "NC".</p> <p>COUNTRY_STANDARD Return either the abbreviation or the full name depending on the format used by the country's postal authority. (Default)</p> <p>EXTENDED Return the full name of the state or province, not the abbreviation. For example "North Carolina".</p>

optionName	Description
Result.CountryType	Specifies the language or code to use for the country name returned by ValidateAddressGlobal.
ISO2	The two-character ISO code for the country
ISO3	The three-character ISO code for the country
ISO_NUMBER	The ISO country number
NAME_CN	Chinese
NAME_DA	Danish
NAME_DE	German
NAME_EN	English (default)
NAME_ES	Spanish
NAME_FI	Finnish
NAME_FR	French
NAME_GR	Greek
NAME_HU	Hungarian
NAME_IT	Italian
NAME_JP	Japanese
NAME_KR	Korean
NAME_NL	Dutch
NAME_PL	Polish
NAME_PT	Portuguese
NAME_RU	Russian
NAME_SA	Sanskrit
NAME_SE	Swedish

optionName	Description														
Result.PreferredScript	<p>Specifies the alphabet in which the output should be returned. The alphabet in which the data is returned differs from country to country. For most countries the output will be Latin I regardless of the selected preferred language.</p> <table border="0"> <tr> <td>ASCII_Extended</td> <td>ASCII characters with expansion of special characters (for example, Å– = OE)</td> </tr> <tr> <td>ASCII_Simplified</td> <td>ASCII characters</td> </tr> <tr> <td>Database</td> <td>(default) Latin I or ASCII characters (as per reference database standard)</td> </tr> <tr> <td>Latin</td> <td>Latin I characters</td> </tr> <tr> <td>Latin_Alt</td> <td>Latin I characters (alternative transliteration)</td> </tr> <tr> <td>Postal_Admin_Alt</td> <td>Latin I or ASCII characters (local postal administration alternative)</td> </tr> <tr> <td>Postal_Admin_Pref</td> <td>Latin I or ASCII characters (as preferred by local postal administration)</td> </tr> </table> <p>For countries that use an alphabet other than Latin I, the returned alphabet differs from country to country. For more information, see Alphabets for Non-Latin 1 Countries on page 703.</p>	ASCII_Extended	ASCII characters with expansion of special characters (for example, Å– = OE)	ASCII_Simplified	ASCII characters	Database	(default) Latin I or ASCII characters (as per reference database standard)	Latin	Latin I characters	Latin_Alt	Latin I characters (alternative transliteration)	Postal_Admin_Alt	Latin I or ASCII characters (local postal administration alternative)	Postal_Admin_Pref	Latin I or ASCII characters (as preferred by local postal administration)
ASCII_Extended	ASCII characters with expansion of special characters (for example, Å– = OE)														
ASCII_Simplified	ASCII characters														
Database	(default) Latin I or ASCII characters (as per reference database standard)														
Latin	Latin I characters														
Latin_Alt	Latin I characters (alternative transliteration)														
Postal_Admin_Alt	Latin I or ASCII characters (local postal administration alternative)														
Postal_Admin_Pref	Latin I or ASCII characters (as preferred by local postal administration)														
Result.PreferredLanguage	<p>Specifies the language in which the output should be returned. The alphabet in which the data is returned differs from country to country, but for most countries the output will be Latin, regardless of the selected preferred language.</p> <table border="0"> <tr> <td>DATABASE</td> <td>Language derived from reference data for each address. Default.</td> </tr> <tr> <td>ENGLISH</td> <td>English locality and state/province names output, if available.</td> </tr> </table>	DATABASE	Language derived from reference data for each address. Default.	ENGLISH	English locality and state/province names output, if available.										
DATABASE	Language derived from reference data for each address. Default.														
ENGLISH	English locality and state/province names output, if available.														
Result.FormatDelimiter	<p>Enables you to use non-standard formatting for multiline addresses in the output. Acceptable values for this field include the following:</p> <ul style="list-style-type: none"> • CRLF (default) • LF • CR • SEMICOLON (2101 MASSACHUSETTS AVE NW ; WASHINGTON DC 20008) • COMMA (2101 MASSACHUSETTS AVE NW , WASHINGTON DC 20008) • TAB (2101 MASSACHUSETTS AVE NW WASHINGTON DC 20008) • PIPE (2101 MASSACHUSETTS AVE NW WASHINGTON DC 20008) • SPACE (2101 MASSACHUSETTS AVE NW WASHINGTON DC 20008) <p>Note: The same value must be selected for both the input option and output option.</p>														

optionName	Description
Result.Casing	Specifies the casing of the output. <ul style="list-style-type: none"> NATIVE Output will be based on the reference database standard. UPPER Output will be in upper case for all countries. LOWER Output will be in lower case for all countries. MIXED Casing determined by country-specific rules. NOCHANGE For parse mode, returns the data the way it was entered. For validation mode, uses the casing found in the reference data and according to postal rules. Values that could not be checked against the reference data will retain their input casing.

Alphabets for Non-Latin 1 Countries

For countries that use an alphabet other than Latin I, the returned alphabet differs from country to country. The following table shows how the output is returned for specific countries. All countries that are not listed use the value specified in the field `Result.PreferredScript` option.

Country	Database	Postal_Admi_Pref	Postal_Admi_Alt	Latin	Latin_Alt	ASCII_Simplified	ASCII_Extended
RUS	Cyrillic	Cyrillic	Cyrillic	CYRILLIC_ISO	CYRILLIC_BGN	CYRILLIC_ISO + LATIN_SIMPLE	CYRILLIC_ISO + LATIN
JPN	Kanji	Kanji	Kana	JAPANESE	JAPANESE	JAPANESE + LATIN_SIMPLE	JAPANESE + LATIN
CHN	Hanzi	Hanzi	Hanzi	CHINESE_MANDARIN	CHINESE_CANTONESE	CHINESE_MANDARIN + LATIN_SIMPLE	CHINESE_MANDARIN + LATIN
HKG	Hanzi	Hanzi	Hanzi	CHINESE_CANTONESE	CHINESE_MANDARIN	CHINESE_CANTONESE + LATIN_SIMPLE	CHINESE_CANTONESE + LATIN
TWN	Hanzi	Hanzi	Hanzi	CHINESE_CANTONESE	CHINESE_MANDARIN	CHINESE_CANTONESE + LATIN_SIMPLE	CHINESE_CANTONESE + LATIN

Country	Database	Post_Admi_Pef	Post_Admi_At	Latin	Latin_Alt	ASCII_Simplified	ASCII_Extended
GRC	Greek	Greek	Greek	GREEK_ISO	GREEK_BGN	GREEK_ISO + LATIN_SIMPLE	GREEK_ISO + LATIN
KOR	Latin	Hangul	Hanja	KOREAN	KOREAN	KOREAN + LATIN_SIMPLE	KOREAN + LATIN
ISR	Latin	Hebrew	Hebrew	HEBREW	HEBREW	HEBREW + LATIN_SIMPLE	HEBREW + LATIN
ROM	Latin-3	Latin-3	Latin-3	Latin-3	Latin-3	LATIN_SIMPLE	LATIN
POL	Latin-2	Latin-2	Latin-2	Latin-2	Latin-2	LATIN_SIMPLE	LATIN
CZE	Latin-2	Latin-2	Latin-2	Latin-2	Latin-2	LATIN_SIMPLE	LATIN
CRI	Latin-2	Latin-2	Latin-2	Latin-2	Latin-2	LATIN_SIMPLE	LATIN
HUN	Latin-2	Latin-2	Latin-2	Latin-2	Latin-2	LATIN_SIMPLE	LATIN
MDA	Latin-2	Latin-2	Latin-2	Latin-2	Latin-2	LATIN_SIMPLE	LATIN
SVK	Latin-2	Latin-2	Latin-2	Latin-2	Latin-2	LATIN_SIMPLE	LATIN
LAT	Latin-7	Latin-7	Latin-7	Latin-7	Latin-7	LATIN_SIMPLE	LATIN

Process Options

Table 116: ValidateAddressGlobal Process Options

optionName	Description
Process.OptimizationLevel	<p data-bbox="493 548 1425 604">Use this option to set the appropriate balance between processing speed and quality. One of the following:</p> <p data-bbox="493 625 1425 682">NARROW The parser will honor input assignment strictly, with the exception of separation of House Number from Street information.</p> <p data-bbox="493 703 1425 982">STANDARD The parser will separate address element more actively as follows:</p> <ul data-bbox="649 751 1273 982" style="list-style-type: none"> • Province will be separated from Locality information • PostalCode will be separated from Locality information • House Number will be separated from Street information • SubBuilding will be separated from Street information • DeliveryService will be separated from Street information • SubBuilding will be separated from Building information • Locality will be separated from PostalCode information <p data-bbox="493 1014 1425 1136">WIDE Parser separation will happen similarly to Standard, but additionally up to 10 parsing candidates will be passed to validation for processing. Validation will widen its search tree and take additional reference data entries into account for matching.</p> <p data-bbox="493 1163 1425 1247">Please note that adjusting the optimization level might have no effect for countries that lack the postal reference data information required for the kind of separation described above.</p> <p data-bbox="493 1268 1425 1381">Increasing separation granularity from Narrow to Standard consumes some processing power, but the major impact on processing speed is from validation processing a larger search tree, thus increasing the number of data accesses and comparisons for the optimization level Wide, in an attempt to make the most out of the input data given.</p>

optionName	Description
Process.Mode	<p data-bbox="493 373 1421 407">Specifies the type of processing to perform on the addresses. One of the following:</p> <p data-bbox="493 422 1421 611">BATCH Use this mode in batch processing environments when no human input or selection is possible. It is optimized for speed and will terminate its attempts to correct an address when ambiguous data is encountered that cannot be corrected automatically. The Batch processing mode will fall back to Parse mode when the database is missing for a specific country.</p> <p data-bbox="808 625 1421 709">Note: When the Process Status returns a value of I3, the attempt is considered a failure and the Status will return a value of F.</p> <p data-bbox="493 751 1421 909">CERTIFIED Use this mode in batch processing environments for Australian mail. Validate Address Global is certified by Australia Post's Address Matching Approval System (AMAS). It will standardize and validate your mail against the Postal Address File, providing postal discounts and allowing for the least amount of undeliverable pieces.</p> <p data-bbox="493 930 1421 1119">FASTCOMPLETION Use this mode if you want to use FastCompletion mode to enter truncated data in address fields and have Validate Address Global generate suggestions. For example, if you work in a call center or point-of-sale environment, you can enter just part of an address element and the FastCompletion feature will provide valid options for the complete element.</p> <p data-bbox="493 1140 1421 1413">INTERACTIVE Use this mode when working in interactive environments to generate suggestions when an address input is ambiguous. This validation type is especially useful in data entry environments when capturing data from customers or prospects. It requires the input of an almost-complete address and will attempt to validate or correct the data provided. If ambiguities are detected, this validation type will generate up to 20 suggestions that can be used for pick lists. The Interactive processing mode will fall back to Parse mode when the respective database is missing for a specific country.</p> <p data-bbox="493 1434 1421 1591">PARSE Use this mode for separating address input into tokens for subsequent processing in other systems, bypassing validation. For example, you could use this mode when address data of already high quality simply needs to be tokenized quickly for export to an external system or for use by a downstream stage.</p>

optionName	Description
Process.MatchingScope	<p>Specifies how closely an address must match the reference data in order for the address to be validated. One of the following:</p> <p>Note: These settings may not have an effect for countries lacking the necessary level of detail in the postal reference data.</p> <p>ALL All address elements must match.</p> <p>DELIVERYPOINT_LEVEL Validate Global Address must achieve a match on StateProvince, PostalCode, City/Locality/Suburb, street, house number, and sub building.</p> <p>STREET_LEVEL Validate Global Address must achieve a match on StateProvince, PostalCode, City/Locality/Suburb, and street.</p> <p>LOCALITY_LEVEL Validate Global Address must achieve a match on StateProvince, PostalCode, and City/Locality/Suburb.</p>

Output

Address Data

Table 117: Parsed Address Elements

columnName	Description
AddressBlock1-9	<p>The AddressBlock output fields contain a formatted version of the standardized or normalized address as it would be printed on a physical mailpiece. Validate Address Global formats the address into address blocks using postal authority standards. Each line of the address is returned in a separate address block field. There can be up to nine address block output fields: AddressBlock1 through AddressBlock9. For example, this input address:</p> <p>AddressLine1: 4200 Parliament Place AddressLine2: Suite 600 City: Lanham StateProvince: MD PostalCode: 20706</p> <p>Results in this address block output:</p> <p>AddressBlock1: 4200 PARLIAMENT PL STE 600 AddressBlock2: LANHAM MD 20706-1882</p>

columnName	Description
AddressLine1-6	<p>If the address was validated, the address line fields contain the validated and standardized address lines. If the address could not be validated, the address line fields contain the input address without any changes. Note that the last line of the address is contained in the LastLine field. For example:</p> <p>AddressLine1: 4200 PARLIAMENT PL STE 600 LastLine: LANHAM MD 20706-1882</p>
AdministrativeDistrict	An area smaller than a state/province but larger than a city.
ApartmentLabel	The flat or unit type (such as STE or APT), for example: 123 E Main St Apt 3
ApartmentNumber	The flat or unit number, for example: 123 E Main St Apt 3
BlockName	An estate or block name.
BuildingName	The name of a building, for example Sears Tower.
City	The name of the town or city. For example, Vancouver , BC.
City.AddInfo	Additional information about the city.
City.SortingCode	A code used by the postal authority to speed up delivery in certain countries for large localities, for example Prague or Dublin.
Contact	The name of the addressee. For example, Mr. Jones .
Country	The country in the language or code specified in the <code>Result.CountryType</code> option.
County	Dependent state or province information that further subdivides a state or province. An example would be a U.S. county.
FirmName	The name of a company.
Floor	Information that further subdivides a building, for example, the suite or apartment number. For example: 123 E Main St Apt 3, 4th Floor

columnName	Description
HouseNumber	The house number 1, for example: 298A-1B New South Head Rd
LastLine	Complete last address line (city, state/province, and postal code).
LeadingDirectional	Street directional that precedes the street name. For example, the N in 138 N Main Street.
Locality	Dependent place name that further subdivides a Locality. Examples are colonias in Mexico, Urbanisaciones in Spain.
POBox	Post Box descriptor (POBox, Postfach, Case Postale etc.) and number.
PostalCode	The postal code for the address. The format of the postcode varies by country.
PostalCode.AddOn	The second part of a postcode. For example, for Canadian addresses this will be the LDU. For U.S. addresses this is the ZIP + 4 add on. This field is not used by most countries.
PostalCode.Base	The base portion of the postcode.
Room	A room number in a building.
SecondaryStreet	The name of a secondary street or rural route.
StateProvince	The name of the state or province.
StreetName	The name of street where property is located, for example: 123 E Main St Apt 3
StreetSuffix	The street suffix, for example: 123 E Main St Apt 3
SubBuilding	A portion of a building, such as a suite. For example, Suite 102.
Suburb	Dependent place name that further subdivides a Locality. An example would be Mahalle in Turkey.
Territory	The name of a territory. Territories are larger than a state/province.

columnName	Description
TrailingDirectional	The trailing directional, for example: 123 Pennsylvania Ave NW

Original Input Data

This option outputs the original input data in <FieldName>.Input fields.

Table 118: Original Input Data

columnName	Format	Description
AddressLine1.Input	String [79]	First address line
AddressLine2.Input	String [79]	Second address line
AddressLine3.Input	String [79]	Third address line
AddressLine4.Input	String [79]	Fourth address line
AddressLine5.Input	String [79]	Fifth address line
AddressLine6.Input	String [79]	Sixth address line
City.Input	String [79]	City name
StateProvince.Input	String [79]	State or province

columnName	Format	Description
PostalCode.Input	String [79]	The postal code for the address. In the U.S. this is the ZIP Code. One of these formats: 99999 99999-9999 A9A9A9 A9A 9A9 9999 999
Contact.Input	String [79]	The name of the addressee. For example, "Mr. Jones".
Country.Input	String [79]	Specify the country using the format you chose for input country format (English name, ISO code, or UPU code). For a list of valid values, see ISO Country Codes and Module Support on page 788.
FirmName.Input	String [79]	The company or firm name.
Street.Input	String [79]	Street
Number.Input	Building [79]	Number
Building.Input	String [79]	Building
SubBuilding.Input	String [79]	SubBuilding
DeliveryService.Input	String [79]	DeliveryService

Result Codes

These output fields contain information about the result of the validation processing.

Table 119: Result Codes

columnName	Result Code
AddressType	<p>For United States and Canada addresses only, the AddressType field indicates the type of address. One of the following:</p> <p>F The address was validated/corrected to the firm name.</p> <p>B The address was validated/corrected to the building name.</p> <p>G The address is a general delivery address.</p> <p>H The address was validated/corrected to the high-rise default.</p> <p>L The address is a large volume receiver.</p> <p>M The address is a military address.</p> <p>P The address was validated/corrected to PO box.</p> <p>R The address was validated/corrected to a rural route.</p> <p>S The address was validated/corrected to a street address.</p> <p>U The address could not be validated/corrected so the type is unknown.</p>
Confidence	<p>The level of confidence assigned to the address being returned. Range is from zero (0) to 100; zero indicates failure, 100 indicates a very high level of confidence that the match results are correct.</p>
CountOverflow	<p>Indicates whether the number of candidate addresses exceeds the number returned. One of the following:</p> <p>Yes Yes, there are additional candidate addresses. To obtain the additional candidates, increase the <code>MaximumResults</code> value.</p> <p>No No, there are no additional candidates.</p>
ElementInputStatus	<p>ElementInputStatus provides per element information on the matching of input elements to reference data. The values in this field vary depending on whether you are using batch mode or parse mode. For information about the value in this field, see Interpreting ElementInputStatus, ElementResultStatus, and ElementRelevance on page 717.</p>
ElementRelevance	<p>Indicates which address elements are actually relevant from the local postal authority's point of view. For information about the value in this field, see Interpreting ElementInputStatus, ElementResultStatus, and ElementRelevance on page 717.</p>

columnName	Result Code												
ElementResultStatus	ElementResultStatus categorizes the result in more detail than the ProcessStatus field by indicating if and how the output fields have been changed from the input fields. For information about the value in this field, see Interpreting ElementInputStatus, ElementResultStatus, and ElementRelevance on page 717.												
MailabilityScore	<p>An estimate of how likely it is that mail sent to the address would be successful delivered. One of the following:</p> <table border="0"> <tr> <td>5</td> <td>Completely confident of deliverability</td> </tr> <tr> <td>4</td> <td>Almost certainly deliverable</td> </tr> <tr> <td>3</td> <td>Should be deliverable</td> </tr> <tr> <td>2</td> <td>Fair chance</td> </tr> <tr> <td>1</td> <td>Risky</td> </tr> <tr> <td>0</td> <td>No chance</td> </tr> </table>	5	Completely confident of deliverability	4	Almost certainly deliverable	3	Should be deliverable	2	Fair chance	1	Risky	0	No chance
5	Completely confident of deliverability												
4	Almost certainly deliverable												
3	Should be deliverable												
2	Fair chance												
1	Risky												
0	No chance												
ModeUsed	Indicates the processing mode used. The processing mode is specified in the <code>Process.Mode</code> option. For a description of the modes, see Process Options on page 705.												
MultimatchCount	If the address was matched to multiple candidate addresses in the reference data, this field contains the number of candidate matches found.												

columnName Result Code

ProcessStatus

columnName

Result Code

Provides a general description of the output quality. For a more detailed description of the output quality, see the ElementResultStatus field.

One of the following:

V4	Verified. The input data is correct. All elements were checked and input matched perfectly.
V3	Verified. The input data is correct on input but some or all elements were standardized or the input contains outdated names or exonyms.
V2	Verified. The input data is correct but some elements could not be verified because of incomplete reference data.
V1	Verified. The input data is correct but the user standardization has deteriorated deliverability (wrong element user standardization - for example, postcode length chosen is too short). Not set by validation.
C4	Corrected. All elements have been checked.
C3	Corrected, but some elements could not be checked.
C2	Corrected, but delivery status unclear (lack of reference data).
C1	Corrected, but delivery status unclear because user standardization was wrong. Not set by validation.
I4	Data could not be corrected completely, but is very likely to be deliverable. Single match (for example, HNO is wrong but only 1 HNO is found in reference data).
I3	Data could not be corrected completely, but is very likely to be deliverable. Multiple matches (for example, HNO is wrong but more than 1 HNO is found in reference data).
I2	Data could not be corrected, but there is a slim chance that the address is deliverable.
I1	Data could not be corrected and is unlikely to be delivered.
RA	Country recognized from the Force country Setting
R9	Country recognized from DefaultCountryISO3 Setting
R8	Country recognized from name without errors
R7	Country recognized from name with errors
R6	Country recognized from territory
R5	Country recognized from province
R4	Country recognized from major town
R3	Country recognized from format
R2	Country recognized from script
R1	Country not recognized - multiple matches

columnName	Result Code
	R0 Country not recognized
	S4 Parsed perfectly
	S3 Parsed with multiple results
	S2 Parsed with errors. Elements change position.
	S1 Parse Error. Input Format Mismatch.
	N1 Validation Error: No validation performed because country was not recognized.
	N2 Validation Error: No validation performed because required reference database is not available.
	N3 Validation Error: No validation performed because country could not be unlocked.
	N4 Validation Error: No validation performed because reference database is corrupt or in wrong format.
	N5 Validation Error: No validation performed because reference database is too old.
	N6 Validation Error: No validation performed because input data was insufficient.
	Q3 FastCompletion Status: Suggestions are available - complete address.
	Q2 FastCompletion Status: Suggested address is complete but combined with elements from the input (added or deleted).
	Q1 FastCompletion Status: Suggested address is not complete (enter more information).
	Q0 FastCompletion Status: Insufficient information provided to generate suggestions.
Status	Reports the success or failure of the processing attempt. null Success F Failure
Status.Code	The reason for the failure, if there was one.
Status.Description	A description of the reason for the failure, if there was one.

Interpreting ElementInputStatus, ElementResultStatus, and ElementRelevance

The ElementInputStatus, ElementResultStatus, and ElementRelevance output fields contain a series of digits that describe the outcome of the validation operation in detail. ElementInputStatus contains some information for parsing operations.

This is what an ElementInputStatus value looks like:

44606040600000000060

This is what an ElementResultStatus value looks like:

88F0F870F00000000040

This is what an ElementRelevance value looks like:

11101010100000000000

To understand the values in these fields you need to know which element each position represents, and the meaning of the values in each position. For example, the first digit indicates the result from the PostalCode.Base output field. The position meanings are listed below.

- Position 1—PostalCode.Base
- Position 2—PostalCode.AddOn
- Position 3—City
- Position 4—Locality and Suburb
- Position 5—StateProvince
- Position 6—County
- Position 7—StreetName
- Position 8—SecondaryStreet
- Position 9—HouseNumber
- Position 10—Number level 1
- Position 11—POBox
- Position 12—Delivery service level 1
- Position 13—Building level 0
- Position 14—BuildingName
- Position 15—Sub building level 0
- Position 16—Floor and Room
- Position 17—FirmName
- Position 18—Organization level 1
- Position 19—Country
- Position 20—Territory

For ElementInputStatus, the possible values for validation are:

- 0—Empty
- 1—Not found
- 2—Not checked (no reference data)

- 3—Wrong - Set by validation only: The reference database suggests that either Number or DeliveryService is out of valid number range. Input is copied, not corrected for batch mode, for interactive mode and FastCompletion suggestions are provided.
- 4—Matched with errors in this element
- 5—Matched with changes (inserts and deletes) For example:
 - Parsing: Splitting of house number for "MainSt 1"
 - Validation: Replacing input that is an exonym or dropping superfluous fielded input that is invalid according to the country reference database
- 6—Matched without errors

For ElementInputStatus, the possible values for parsing are:

- 0—Empty
- 1—Element had to be relocated
- 2—Matched but needed to be normalized
- 3—Matched

For ElementRelevance, the possible values for parsing are:

- 0—Empty
- 1—Element had to be relocated
- 2—Matched but needed to be normalized
- 3—Matched

For ElementResultStatus, the possible values are (for all address elements apart from country):

- 0—Empty
- 1—Not validated and not changed. Original is copied.
- 2—Not validated but standardized.
- 3—Validated but not changed due to invalid input, database suggests that number is out of valid ranges. Input is copied, not corrected - this status value is only set in batch mode.
- 4—Validated but not changed due to lack of reference data.
- 5—Validated but not changed due to multiple matches. Only set in batch mode, otherwise multiple suggestions that replace the input are marked as corrected (status value 7).
- 6—Validated and changed by eliminating the input value
- 7—Validated and changed due to correction based on reference data
- 8—Validated and changed by adding value based on reference data
- 9—Validated, not changed, but delivery status not clear (e.g. DPV value wrong; given number ranges that only partially match reference data).
- C—Validated, verified but changed due to outdated name
- D—Validated, verified but changed from exonym to official name
- E—Validated, verified but changed due to standardization based on casing or language. Validation only sets this status if input fully matches a language alternative.
- F—Validated, verified and not changed due to perfect match

For Country (position 19 & 20), the following values are possible:

- 0—Empty
- 1—Country not recognized
- 4—Country recognized from DefaultCountryISO3 setting
- 5—Country not recognized - multiple matches
- 6—Country recognized from script
- 7—Country recognized from format
- 8—Country recognized from major town
- 9—Country recognized from province
- C—Country recognized from territory
- D—Country recognized from name with errors
- E—Country recognized from name without errors
- F—Country recognized from ForceCountryISO3 setting

ValidateAddressLoqate

ValidateAddressLoqate standardizes and validates addresses using postal authority address data. ValidateAddress Loqate can correct information and format the address using the format preferred by the applicable postal authority. It also adds missing postal information, such as postal codes, city names, state/province names, and so on.

ValidateAddressLoqate also returns result indicators about validation attempts, such as whether or not ValidateAddressLoqate validated the address, the level of confidence in the returned address, the reason for failure if the address could not be validated, and more.

During address matching and standardization, ValidateAddressLoqate separates address lines into components and compares them to the contents of the Universal Addressing Module databases. If a match is found, the input address is *standardized* to the database information. If no database match is found, ValidateAddressLoqate optionally *formats* the input addresses. The formatting process attempts to structure the address lines according to the conventions of the appropriate postal authority.

ValidateAddressLoqate is part of the Universal Addressing Module.

Input

Table 120: Input Format

columnName	Format	Description
AddressLine1	String	The first address line.

columnName	Format	Description
AddressLine2	String	The second address line.
AddressLine3	String	The third address line.
AddressLine4	String	The fourth address line.
City	String	The city name.
Country	String	<p>The country code or name, in any of the following formats:</p> <ul style="list-style-type: none"> • Two-character ISO 3166-1 Alpha 2 country code • Three-character ISO 3166-1 Alpha 3 country code • English country name <p>See ISO Country Codes and Module Support on page 788 for a list of ISO codes.</p>
FirmName	String	The company or firm name.
PostalCode	String	<p>The postal code for the address in one of these formats:</p> <p>99999 99999-9999 A9A9A9 A9A 9A9 9999 999</p>
StateProvince	String	The state or province.

Options

The following table lists the options that control the type of information returned by `ValidateAddress` or `Locate`.

Table 121: Output Data Options

optionName	Description
Database.Loqate	Specifies which database you want to use for validating international addresses. To specify a database for international address validation, select a database in the Database drop-down list.
OutputFieldLevelReturnCodes	Specifies whether to include field-level result indicators. Field-level result indicators describe how ValidateAddressLoqate handled each address element. Field-level result indicators are returned in the qualifier "Result". For example, the field-level result indicator for HouseNumber is contained in HouseNumber.Result . For a complete listing of result indicator output fields, see Result Indicators on page 738. N No, do not output field-level return codes (default). Y Yes, output field-level return codes.

optionName	Description
OutputFormattedOnFail	<p>Specifies whether to return a formatted address when an address cannot be validated. The address is formatted using the preferred address format for the address's country. If this option is not selected, the output address fields are blank when ValidateAddressLoqate cannot validate the address.</p> <p>N No, do not format failed addresses (default).</p> <p>Y Yes, format failed addresses.</p> <p>Formatted addresses are returned using the format specified by the Include a standard address, Include address line elements, and Include postal information check boxes. Note that if you select Include address line elements, the parsed address elements will contain the parsed, validated address for addresses that could be validated. If the address could not be validated the parsed address elements will contain the input address in parsed form. If you always want the output to contain the input address in parsed form, regardless of whether or not ValidateAddressLoqate could validate the address, select Include standardized input address elements.</p> <p>If you check this option, you must select Include a standard address and/or Include address line elements.</p> <p>Formatted addresses are returned using the format specified by the OutputRecordType option. Note that if you specify OutputRecordType=E, the parsed address elements will contain the parsed, validated address for addresses that could be validated. If the address could not be validated the parsed address elements will contain the input address in parsed form. If you always want the output to contain the input address in parsed form, regardless of whether or not ValidateAddressLoqate could validate the address, specify OutputRecordType=I.</p> <p>If you specify Y, you must specify "A" and/or "E" for OutputRecordType.</p> <p>Formatted addresses are returned using the format specified by the Option.OutputRecordType option. Note that if you specify Option.OutputRecordType=E, the parsed address elements will contain the parsed, validated address for addresses that could be validated. If the address could not be validated the parsed address elements will contain the input address in parsed form. If you always want the output to contain the input address in parsed form, regardless of whether or not ValidateAddressLoqate could validate the address, specify Option.OutputRecordType=I.</p>

optionName	Description				
OutputAddressBlocks	<p data-bbox="690 373 1429 495">Specifies whether to return a formatted version of the address as it would be printed on a physical mailpiece. Each line of the address is returned in a separate address block field. There can be up to nine address block output fields: AddressBlock1 through AddressBlock9.</p> <p data-bbox="690 510 1032 543">For example, this input address:</p> <p data-bbox="690 558 1091 705">AddressLine1: 4200 Parliament Place AddressLine2: Suite 600 City: Lanham StateProvince: MD PostalCode: 20706</p> <p data-bbox="690 720 1073 753">Results in this address block output:</p> <p data-bbox="690 768 1211 865">AddressBlock1: 4200 PARLIAMENT PL STE 600 AddressBlock2: LANHAM MD 20706-1882 AddressBlock3: UNITED STATES OF AMERICA</p> <p data-bbox="690 879 1429 1031">ValidateAddressLoqate formats the address into address blocks using postal authority standards. The country name is returned using the Universal Postal Union country name. Note that the option OutputCountryFormat does not affect the country name in the address block, it only affects the name returned in the Country output field.</p> <p data-bbox="690 1045 911 1079">One of the following:</p> <table data-bbox="690 1094 1269 1167"><tr><td data-bbox="690 1094 716 1127">N</td><td data-bbox="824 1094 1269 1127">No, do not return address blocks. Default.</td></tr><tr><td data-bbox="690 1142 716 1176">Y</td><td data-bbox="824 1142 1114 1176">Yes, return address blocks.</td></tr></table>	N	No, do not return address blocks. Default.	Y	Yes, return address blocks.
N	No, do not return address blocks. Default.				
Y	Yes, return address blocks.				

optionName	Description
AmasFormatting	<p>Specifies that output address data is to be formatted using Address Matching Approval System (AMAS) conventions.</p> <p>This option causes Validate Address Loqate to use AMAS rules when standardizing an address. AMAS is an Australia Post program for enforcing addressing standards. For more information on the AMAS formatting conventions, refer to the Address Matching Approval System (AMAS) Handbook.</p> <p>This option modifies the output data as follows.</p> <ul style="list-style-type: none"> • Numeric fields are padded with zeros. This affects the following output fields: HouseNumber, HouseNumber2, PostalDeliveryNumber, and DPID. For example, if the input address is 298 New South Head Rd Double Bay NSW 2028, then the format of the HouseNumber field is changed from 298 to 00298. • If a match is not made, then all digits in the DPID field will be zero. For example, 00000000. • If a match is not made, then all return fields (parsed address elements) will be blank, except numeric fields which will contain all zeros. • The CCD field is not output. <p>Valid values are:</p> <p>N No, do not format the output data using AMAS conventions (default).</p> <p>Y Yes, format the output data using AMAS conventions.</p> <p>Note: When this option is selected, results will be returned with AMAS formatting regardless of selections made in the Acceptance level and Minimum match score fields.</p>
OutputCasing	<p>Specifies the casing of the output data. One of the following:</p> <p>M Returns the output in mixed case (default). For example:</p> <pre>123 Main St Mytown FL 12345</pre> <p>U Returns the output in upper case. For example:</p> <pre>123 MAIN ST MYTOWN FL 12345</pre>

optionName	Description
HomeCountry	<p>Specifies the default country. You should specify the country where most of your addresses reside. For example, if most of the addresses you process are in Germany, specify Germany. ValidateAddressLoqate uses the country you specify to attempt validation when it cannot determine the country from the StateProvince, PostalCode, and Country address fields. The valid country names are:</p> <p>Afghanistan, Albania, Algeria, American Somoa, Andorra, Angola, Anguilla, Antigua And Barbuda, Argentina, Armenia, Aruba, Australia, Austria, Azerbaijan, Bahamas, Bahrain, Bangladesh, Barbados, Belarus, Belgium, Belize, Benin, Bermuda, Bhutan, Bolivia, Bosnia And Herzegovina, Botswana, Brazil, British Virgin Islands, Brunei Darussalam, Bulgaria, Burkina Faso, Burundi, Cambodia, Cameroon, Canada, Cape Verde, Cayman Islands, Central African Republic, Chad, Chile, China, Colombia, Comoros Islands, Congo, Cook Islands, Costa Rica, Cote D'Ivoire, Croatia, Cuba, Cyprus, Czech Republic, Democratic Republic Of Congo, Denmark, Djibouti, Dominica, Dominican Republic, East Timor, Ecuador, Egypt, El Salvador, Equitorial Guinea, Eritrea, Estonia, Ethiopia, Falkland Islands, Faroe Islands, Federated States Of Micronesia, Fiji, Finland, France, French Guiana, Gabon, Gambia, Germany, Ghana, Gibraltar, Greece, Greenland, Grenada, Guadeloupe, Guam, Guatemala, Guinea, Guinea Bissau, Guyana, Haiti, Holy See, Honduras, Hong Kong, Hungary, Iceland, India, Indonesia, Iran, Iraq, Ireland, Israel, Italy, Jamaica, Japan, Jordan, Kazakhstan, Kenya, Kiribati, Korea, Kuwait, Kyrgyzstan, Laos, Latvia, Lebanon, Lesotho, Liberia, Libya, Liechtenstein, Lithuania, Luxembourg, Macau, Macedonia, Madagascar, Malawi, Malaysia, Maldives, Mali, Malta, Marshall Islands, Martinique, Mauritania, Mauritius, Mayotte, Mexico, Moldova, Monaco, Mongolia, Monserrat, Morocco, Mozambique, Myanmar, Namibia, Nauru, Nepal, Netherlands Antilles, New Caledonia, New Zealand, Nicaragua, Niger, Nigeria, Niue, Norway, Oman, Pakistan, Palau, Panama, Papua New Guinea, Paraguay, Peru, Philippines, Pitcairn Islands, Poland, Portugal, Puerto Rico, Qatar, Republic Of Georgia, Republic Of Korea, Republic Of Singapore, Reunion, Romania, Russia, Rwanda, Saint Helena, Saint Kitts And Nevis, Saint Lucia, Saint Pierre And Miquelon, Saint Vincent And The Grenadines, Samoa, San Marino, Sao Tome and Principe, Saudi Arabia, Senegal, Seychelles, Sierra Leone, Slovakia, Slovenia, Solomon Islands, Somalia, South Africa, Spain, Sri Lanka, Sudan, Surivalue, Swaziland, Sweden, Switzerland, Syria, Tahiti, Taiwan, Tajikistan, Tanzania, Thailand, The Netherlands, Togo, Tonga, Trinidad And Tobago, Tristan Da Cunha, Tunisia, Turkey, Turkmenistan, Turks And Caicos Islands, Tuvalu, Uganda, Ukraine, United Arab Emirates, United Kingdom, United States, Uruguay, Uzbekistan, Vanuatu, Venezuela, Vietnam, Virgin Islands (US), Wallis And Futuna, Yemen, Yugoslavia, Zambia, Zimbabwe</p>

optionName	Description
OutputCountryFormat	<p>Specifies the format to use for the country name returned in the Country output field. For example, if you select English, the country name "Deutschland" would be returned as "Germany".</p> <p>E Use English country names (default).</p> <p>I Use two-letter ISO abbreviation for the countries instead of country names.</p> <p>U Use Universal Postal Union abbreviation for the countries instead of country names.</p>
OutputScript	<p>Specifies the alphabet or script in which the output should be returned. This option is bi-directional and generally takes place from Native to Latin and Latin to Native.</p> <p>Input Do not perform transliteration and provide output in the same script as the input (default).</p> <p>Native Output in the native script for the selected country wherever possible.</p> <p>Latn Use English values.</p>

optionName	Description
Acceptance level AcceptanceLevel	<p data-bbox="690 363 1438 491">Specifies the minimum verification level a record must reach to be considered successfully processed. The value in this field corresponds to the second character of the Address Verification Code, which is called "Post-Processed Verification Match Level":</p> <ul data-bbox="690 514 1438 1633" style="list-style-type: none"> <li data-bbox="690 514 1438 779">• 5—Delivery point (building or post box). The record will be passed or will have high confidence if ApartmentNumber, HouseNumber, Street, City, and StateProvince supplied in the input record match to the Loqate reference dataset. Will have moderate confidence if ApartmentNumber is correct but other remaining fields are incorrect, but in this case the Loqate engine should be able to identify the ApartmentNumber as ApartmentNumber is at a more granular level. It will have zero confidence if ApartmentNumber and other fields are unable to be parsed by the Loqate engine. <li data-bbox="690 781 1438 1024">• 4—Premise or building. The record will be passed or will have high confidence if House Number, Street, City, and StateProvince supplied in the input record match the Loqate reference dataset. Will have moderate confidence if HouseNumber is correct but the other fields are not; however, in this case the Loqate engine should be able to identify the HouseNumber because HouseNumber is at a more granular level. It will have zero confidence if the HouseNumber and other fields are unable to be parsed by the Loqate engine. <li data-bbox="690 1026 1438 1270">• 3—Thoroughfare, road, or street. The record will be passed or will have high confidence if Street, City, and StateProvince supplied in the input record match the Loqate reference dataset. Will have moderate confidence if City is correct but StateProvince is not; however, in this case the Loqate engine should be able to identify the StateProvince as City itself is the part of StateProvince. It will have zero confidence if City or both fields (City and State Province) are unable to be parsed by the Loqate engine. <li data-bbox="690 1272 1438 1516">• 2—Locality (city or town). The record will be passed or will have high confidence if both City and StateProvince supplied in the input record match the Loqate reference dataset. Will have moderate confidence if City is correct but StateProvince is not; however, in this case the Loqate Engine should be able to identify the StateProvince as City itself is the part of StateProvince. It will have zero confidence if City or both fields (City and StateProvince) are unable to be parsed by the Loqate engine. <li data-bbox="690 1518 1438 1604">• 1—Administrative area (state or region). The record will be passed or will have high confidence if the StateProvince supplied in the input record matches the Loqate reference dataset. <li data-bbox="690 1606 1438 1633">• 0—None. This is equivalent to loosest match option.

optionName	Description
IsDuplicateHandlingMaskEnable	<p>Enables the duplicate handling mask and specifies how duplicate records are processed and removed. Select one or more of the following options:</p> <ul style="list-style-type: none"> S Selected by default. Preprocess the input and remove duplicates that occur in a single field. C Selected by default. Pre-process the input and remove duplicates across all fields. T Pre-process the input and remove duplicates in fields that are not standard address fields. F Selected by default. Post-process the output from verification and remove duplicates from non-verified fields.
MinimumMatchScore	<p>Specifies a numeric value between 0 and 100 that indicates the degree to which Validate Address Loqate will change an address in order to obtain a match in the Loqate reference database. The lower the number, the greater amount of change is allowed. A value of 100 means that after parsing the input address is nearly identical to the validated address. A value of 0 means that the parsed input address may be completely changed in order to obtain a validated address.</p>
KeepMultimatch	<p>Specifies whether or not to return multiple address for those input addresses that have more than one possible match.</p> <ul style="list-style-type: none"> Y Yes, return multiple matches (default). N No, do not return multiple matches. <p>For more information, see Returning Multiple Matches on page 728.</p>
FailMultipleMatches	<p>Fails multiple addresses for those input addresses that have more than one possible match.</p>

Returning Multiple Matches

If ValidateAddressLoqate finds multiple address in the postal database that are possible matches for the input address, you can have ValidateAddressLoqate return the possible matches. For example, the following address matches multiple addresses in the U.S. postal database:

PO BOX 1 New York, NY

Options

To return multiple matches, use the options described in the following table.

Table 122: Multiple Match Option

optionName	Description/Valid Values
KeepMultimatch	<p>Indicates whether or not to return multiple address for those input addresses that have more than one possible match.</p> <p>Y Yes, return multiple matches (default).</p> <p>N No, do not return multiple matches.</p>
MaximumResults	<p>A number between 1 and 10 that indicates the maximum number of addresses to return. The default value is 1.</p> <p>Note: The difference between Keepmultimatch=N and KeepMultimatch=Y/MaximumResults=1 is that a multiple match will return a failure if KeepMultimatch=N, whereas a multiple match will return one record if KeepMultimatch=Y and MaximumResults=1.</p>
OutputFieldLevelReturnCodes	<p>To identify which output addresses are candidate addresses, you must specify a value of Y for OutputFieldLevelReturnCodes. When you do this, records that are candidate addresses will have one or more "M" values in the field-level result indicators.</p>

Output

When you choose to return multiple matches, the addresses are returned in the address format you specify. For information on specifying address format, see [Options](#) on page 720. To identify which records are the candidate addresses, look for multiple "M" values in the field-level result indicators. For more information, see [Result Indicators](#) on page 738.

Match Score Threshold Options

There are two options for setting match score thresholds.

Note: These options are not available in the Validate Address Loqate user interface; they are located in the following file:

```
SpectrumDirectory/server/modules/loqate/env.properties
```

The **MatchScoreAbsoluteThreshold** option is used to specify the minimum match score a record must reach to be considered a candidate for matching. The default value is 60, and the maximum value is 100.

The **MatchScoreThresholdFactor** is a value that represents a factor of the highest matching result. This value is used as a cutoff for considering result candidates. The higher the value of the factor,

the higher the chance of getting a good verification result. The default value is 95 and the maximum value is 100.

Output

The output from `ValidateAddressLoqate` contains various information depending on the output categories you select.

Standard Address Output

Standard address output consists of four lines of the address which correspond to how the address would appear on an address label. City, state/province, postal code, and other data is also included in standard address output. `ValidateAddressLoqate` returns standard address output for validated addresses if you set **OutputRecordType = A**. Standard address fields are always returned for addresses that could not be validated regardless of whether or not you set **OutputRecordType = A**. For non-validated addresses, the standard address output fields contain the address as it appeared in the input ("pass through" data). If you want `ValidateAddressLoqate` to standardize address according to postal authority standards when validation fails, specify **OutputFormattedOnFail = Y** in your request.

Table 123: Standard Address Output

columnName	Description
AdditionalInputData	Input data that could not be matched to a particular address component. For more information, see About Additional Input Data .
AddressLine1-4	If the address was validated, the first line of the validated and standardized address. If the address could not be validated, the first line of the input address without any changes. There can be up to four address block output fields: AddressLine1 through AddressLine4.
City	The validated city name.
Country	The country in the format determined by what you selected in <code>OutputCountryFormat</code> : <ul style="list-style-type: none"> • ISO Code • UPU Code • English
FirmName	The validated firm or company name.

columnName	Description
PostalCode	The validated ZIP Code™ or postal code.
PostalCode.AddOn	The 4-digit add-on part of the ZIP Code™. For example, in the ZIP Code™ 60655-1844, 1844 is the 4-digit add-on.
PostalCode.Base	The 5-digit ZIP Code™; for example 20706.
StateProvince	The validated state or province abbreviation.

Parsed Address Elements Output

Output addresses are formatted in the parsed address format if you set **OutputRecordType = E**. If you want `ValidateAddressLoqate` to return formatted data in the Parsed Address format when validation fails (that is, a normalized address), specify **OutputFormattedOnFail = Y**.

Note: If you want `ValidateAddressLoqate` to always return parsed input data regardless of whether or not validation is successful, specify **OutputRecordType = I**. For more information, see [Parsed Input](#) on page 734.

Table 124: Parsed Address Output

columnName	Description
AddressBlock1-9	<p>The AddressBlock output fields contain a formatted version of the standardized or normalized address as it would be printed on a physical mailpiece. Validate Address Global formats the address into address blocks using postal authority standards. Each line of the address is returned in a separate address block field. There can be up to nine address block output fields: AddressBlock1 through AddressBlock9. For example, this input address:</p> <p>AddressLine1: 4200 Parliament Place AddressLine2: Suite 600 City: Lanham StateProvince: MD PostalCode: 20706</p> <p>Results in this address block output:</p> <p>AddressBlock1: 4200 PARLIAMENT PL STE 600 AddressBlock2: LANHAM MD 20706-1882</p>
ApartmentLabel	Apartment designator (such as STE or APT), for example: 123 E Main St APT 3
ApartmentNumber	Apartment number, for example: 123 E Main St APT 3
ApartmentNumber2	<p>Secondary apartment number, for example: 123 E Main St APT 3, 4th Floor</p> <p>Note: In this release, this field will always be blank.</p>
Building	Descriptive name identifying an individual location.
City	Validated city name

columnName	Description
Country	Country. Format is determined by what you selected in OutputCountryFormat: <ul style="list-style-type: none"> • ISO Code • UPU Code • English
County*	The smallest geographic data element within a country, for instance, USA County
FirmName	The validated firm or company name
HouseNumber	House number, for example: 123 E Main St Apt 3
LeadingDirectional	Leading directional, for example: 123 E Main St Apt 3
POBox	Post office box number. If the address is a rural route address, the rural route box number will appear here.
PostalCode	Validated postal code. For U.S. addresses, this is the ZIP Code.
Principality *	The largest geographic data element within a country
StateProvince	Validated state or province name
StreetAlias	Alternate street name; typically applies only to a specific range of addresses on the street. If you do not allow street aliases in the output then the street's "base" name will appear in the output regardless of whether or not there is an alias for the street. for example: 123 E Main St Apt 3
StreetName	Street name, for example: 123 E Main St Apt 3

columnName	Description
StreetSuffix	Street suffix, for example: 123 E Main St Apt 3
Subcity*	A smaller population center data element, dependent on the contents of the Locality field. For instance, Turkish Neighbourhood .
Substreet*	The dependent street or block data element within a country. For instance, UK Dependent Street .
TrailingDirectional	Trailing directional, for example: 123 Pennsylvania Ave NW

*This is a subfield and may not contain data.

Parsed Input

The output can include the input address in parsed form. This type of output is referred to as "parsed input." Parsed input fields contain the address data that was used as input regardless of whether or not ValidateAddress validated the address. Parsed input is different from the "parsed address elements" output in that parsed address elements contain the validated address if the address could be validated, and, optionally, the input address if the address could not be validated. Parsed input always contains the input address regardless of whether or not ValidateAddress validated the address.

To include parsed input fields in the output, set **OutputRecordType = I**.

Table 125: Parsed Input

columnName	Description
ApartmentLabel.Input	Apartment designator (such as STE or APT), for example: 123 E Main St APT 3
ApartmentNumber.Input	Apartment number, for example: 123 E Main St APT 3
City.Input	Validated city name

columnName	Description
Country.Input	Country. Format is determined by what you selected in OutputCountryFormat: <ul style="list-style-type: none"> • ISO Code • UPU Code • English
County.Input*	The smallest geographic data element within a country, for instance, USA County
FirmName.Input	The validated firm or company name
HouseNumber.Input	House number, for example: 123 E Main St Apt 3
LeadingDirectional.Input	Leading directional, for example: 123 E Main St Apt 3
POBox.Input	Post office box number. If the address is a rural route address, the rural route box number will appear here.
PostalCode.Input	Validated postal code. For U.S. addresses, this is the ZIP Code.
Principality.Input *	The largest geographic data element within a country
StateProvince.Input	Validated state or province name
StreetAlias.Input	Alternate street name; typically applies only to a specific range of addresses on the street. If you do not allow street aliases in the output then the street's "base" name will appear in the output regardless of whether or not there is an alias for the street. The base name is the name that applies to the entire street. For example: If StreetName is "N MAIN ST" the StreetAlias field would contain "MAIN" and the thoroughfare type, "ST", would be returned in the StreetSuffix field.

columnName	Description
StreetName.Input	Street name, for example: 123 E Main St Apt 3
StreetSuffix.Input	Street suffix, for example: 123 E Main St Apt 3
Subcity.Input*	A smaller population center data element, dependent on the contents of the Locality field. For instance, Turkish Neighbourhood .
Substreet.Input*	The dependent street or block data element within a country. For instance, UK Dependent Street .
TrailingDirectional.Input	Trailing directional, for example: 123 Pennsylvania Ave NW

*This is a subfield and may not contain data.

Geocode Output

ValidateAddressLoqate returns the latitude/longitude, geocoding match code, dependent and double dependent localities, dependent thoroughfare, subadministrative and superadministrative areas, and the search distance as output. Match codes describe how well the geocoder matched the input address to a known address; they also describe the overall status of a match attempt. Search distance codes represent how close the geocode is to the actual physical location of an address.

Table 126: Geocode Address Output

columnName	Description
Geocode.MatchCode	<p>This two-byte code reflects the status and level of geocode matching for an address. The first byte represents the geocoding status and is one of the following:</p> <p>A Multiple candidate geocodes were found to match the input address, and an average of these was returned</p> <p>I A geocode was able to be interpolated from the input addresses location in a range</p> <p>P A single geocode was found matching the input address</p> <p>U A geocode was not able to be generated for the input address</p> <p>The second byte represents the level of geocoding matching and is one of the following:</p> <p>5 Delivery point (post box or subbuilding)</p> <p>4 Premise or building</p> <p>3 Thoroughfare</p> <p>2 Locality</p> <p>1 Administrative area</p> <p>0 None</p>
Latitude	Eight-digit number in degrees and calculated to five decimal places (in the format specified).
Longitude	Eight-digit number in degrees and calculated to five decimal places (in the format specified).
SearchDistance	The radius of accuracy in meters, providing an indication of the probable maximum distance between the given geocode and the actual physical location. This field is derived from and dependent upon the accuracy and coverage of the underlying reference data.

Table 127: City/Street/Postal Code Centroid Match Codes

Element	Match Code
Address Point	P4

Element	Match Code
Address Point Interpolated	I4
Street Centroid	A4/P3
Postal Code/City Centroid	A3/P2/A2

Note: Geocode.Match.Code does not return two coordinates for a street segment (such as the beginning and ending of a portion of a street). Instead, with input resulting in return codes of I3 (interpolated to thoroughfare or street level, where no input premise number was provided), the complete street is used in the computation.

Result Indicators

Result indicators provide information about the kinds of processing performed on an address. There are two types of result indicators:

Record-Level Result Indicators

Record-level result indicators provide data about the results of ValidateAddressLoqate processing for each record, such as the success or failure of the match attempt, which coder processed the address, and other details. The following table lists the record-level result indicators returned by ValidateAddressLoqate.

Table 128: Record Level Indicators

columnName	Description
Confidence	The level of confidence assigned to the address being returned. Range is from zero (0) to 100; zero indicates failure, 100 indicates a very high level of confidence that the match results are correct. For multiple matches, the confidence level is 0. For details about how this number is calculated, see Introduction to the Validate Address Confidence Algorithm on page 755.

columnName	Description
CouldNotValidate	<p>If no match was found, which address component could not be validated:</p> <ul style="list-style-type: none"> • ApartmentNumber • HouseNumber • StreetName • PostalCode • City • Directional • StreetSuffix • Firm • POBoxNumber <p>Note: More than one component may be returned, in a comma-separated list.</p>
MatchScore	<p>MatchScore provides an indication of the similarity between the input data and the closest reference data match. It is significantly different from Confidence in that Confidence indicates how much the input address changed to obtain a match, whereas the meaning of Match Score varies between U.S. and non-U.S. addresses.</p> <p>The int getFieldMatchscore (unit record, const char*) field is a decimal value between 0 and 100 that reflects the similarity between the identified input data and the closest reference data match. A result of 100 indicates that no changes other than alias, casing, or diacritic changes have been made to the input data. A result of 0 indicates that there is no similarity between the input data and closest reference data match.</p> <p>Note: The Validate Address Loqate and Advanced Matching Module components both use the MatchScore field. The MatchScore field value in the output of a dataflow is determined by the last stage to modify the value before it is sent to an output stage. If you have a dataflow that contains Validate Address Loqate and Advanced Matching Module components and you want to see the MatchScore field output for each stage, use a Transformer stage to copy the MatchScore value to another field. For example, Validate Address Loqate produces an output field called MatchScore and then a Transformer stage copies the MatchScore field from Validate Address Loqate to a field called AddressMatchScore. When the matcher stage runs it populates the MatchScore field with the value from the matcher and passes through the AddressMatchScore value from Validate Address Loqate.</p>
ProcessedBy	<p>Which address coder processed the address:</p> <p>LOQATE The Loqate coder processed the address.</p>

columnName	Description				
Status	<p>Reports the success or failure of the match attempt. For multiple matches, this field is "F" for all the possible matches.</p> <table> <tr> <td>null</td> <td>Success</td> </tr> <tr> <td>F</td> <td>Failure</td> </tr> </table>	null	Success	F	Failure
null	Success				
F	Failure				
Status.Code	<p>Reason for failure, if there is one.</p> <ul style="list-style-type: none"> • UnableToValidate 				
Status.Description	<p>Description of the problem, if there is one.</p> <table> <tr> <td>Address Not Found</td> <td>This value will appear if Status.Code=UnableToValidate.</td> </tr> </table>	Address Not Found	This value will appear if Status.Code=UnableToValidate.		
Address Not Found	This value will appear if Status.Code=UnableToValidate.				

Field-Level Result Indicators

Field-level result indicators describe how ValidateAddressLoqate handled each address element. Field-level result indicators are returned in the qualifier "Result". For example, the field-level result indicator for HouseNumber is contained in **HouseNumber.Result**.

To enable field-level result indicators, specify **OutputFieldLevelReturnCodes=Y**.

The following table lists the field-level result indicators. If a particular field does not apply to an address, the result indicator may be blank.

Table 129: Field-Level Result Indicators

columnName		Description
ApartmentLabel.Result	A	Appended. The field was added to a blank input field. U.S. and Canadian addresses only.
	C	Corrected. U.S. and Canadian addresses only.
	F	Formatted. The spacing and/or punctuation was changed to conform to postal standards.
	P	Pass-through. The data was not used in the validation process, but it was preserved in the output. U.S. and Canadian addresses only.
	R	The apartment label is required but is missing from the input address. U.S. addresses only.
	S	Standardized. This option includes any standard abbreviations.
	U	Unmatched. Does not apply to Canadian addresses.
	V	Validated. The data was confirmed correct and remained unchanged from input.
ApartmentNumber.Result	A	Appended. The field was added to a blank input field. U.S. and Canadian addresses only.
	C	Corrected. Canadian addresses only.
	F	Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.
	P	Pass-through. The data was not used in the validation process, but it was preserved in the output. U.S. addresses that are an EWS match will have a value of P. U.S. and Canadian addresses only.
	R	The apartment number is required but is missing from the input address. U.S. addresses only.
	S	Standardized. This option includes any standard abbreviations. Does not apply to U.S. addresses.
	U	Unmatched.
	V	Validated. The data was confirmed correct and remained unchanged from input.

columnName	Description
City.Result	<p>A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.</p> <p>C Corrected. U.S. and Canadian addresses only.</p> <p>F Hyphens missing or punctuation errors. Canadian addresses only.</p> <p>M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. Does not apply to U.S. or Canadian addresses.</p> <p>P Pass-through. The data was not used in the validation process, but it was preserved in the output.</p> <p>R The city is required but is missing from the input address. U.S. addresses only.</p> <p>S Standardized. This option includes any standard abbreviations. Does not apply to U.S. addresses.</p> <p>U Unmatched. Does not apply to Canadian addresses.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>
Country.Result	<p>These result codes do not apply to U.S. or Canadian addresses.</p> <p>M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>U Unmatched.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>
County.Result*	The smallest geographic data element within a country, for instance, USA County
FirmName.Result	<p>C Corrected. U.S. addresses only.</p> <p>P Pass-through. The data was not used in the validation process, but it was preserved in the output. U.S. and Canadian addresses only.</p> <p>U Unmatched. U.S. and Canadian addresses only.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input. U.S. addresses only.</p>

columnName		Description
HouseNumber.Result	A	Appended. The field was added to a blank input field. Canadian addresses only.
	C	Corrected. Canadian addresses only.
	F	Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.
	O	Out of range. Does not apply to U.S. or Canadian addresses.
	P	Pass-through. The data was not used in the validation process, but it was preserved in the output. Canadian addresses only.
	R	The house number is required but is missing from the input address. Canadian addresses only.
	S	Standardized. This option includes any standard abbreviations. Does not apply to U.S. or Canadian addresses.
	V	Validated. The data was confirmed correct and remained unchanged from input.
LeadingDirectional.Result	A	Appended. The field was added to a blank input field. U.S. and Canadian addresses only.
	C	Corrected. Non-blank input was corrected to a non-blank value. U.S. addresses only.
	F	Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.
	M	Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. U.S. addresses only.
	P	Pass-through. The data was not used in the validation process, but it was preserved in the output. Canadian addresses only.
	S	Standardized. This option includes any standard abbreviations.
	U	Unmatched.
	V	Validated. The data was confirmed correct and remained unchanged from input. Does not apply to Canadian addresses.

columnName	Description
POBox.Result	A Appended. The field was added to a blank input field. Canadian addresses only.
	C Corrected. Canadian addresses only.
	F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.
	M Multiple matches. The input address matched multiple records in the postal database, and each matching record has a different value in this field. U.S. addresses only.
	P Pass-through. The data was not used in the validation process, but it was preserved in the output. Canadian addresses only.
	R The P.O. Box number is required but is missing from the input address. U.S. addresses only.
	S Standardized. This option includes any standard abbreviations.
	U Unmatched.
PostalCode.Result	V Validated. The data was confirmed correct and remained unchanged from input.
	A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.
	C Corrected. U.S. and Canadian addresses only.
	F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.
	M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. Does not apply to Canadian addresses.
	P Pass-through. The data was not used in the validation process, but it was preserved in the output. Does not apply to U.S. addresses.
	R The postal code is required but is missing from the input address. U.S. addresses only.
	S Standardized. This option includes any standard abbreviations. Does not apply to U.S. or Canadian addresses.
U Unmatched. For example, if the street name does not match the postal code, both StreetName.Result and PostalCode.Result will contain U.	
V Validated. The data was confirmed correct and remained unchanged from input.	

columnName	Description
PostalCode.Type	<p>P The ZIP Code™ contains only PO Box addresses. U.S. addresses only.</p> <p>U The ZIP Code™ is a unique ZIP Code™ assigned to a specific company or location. U.S. addresses only.</p> <p>M The ZIP Code™ is for military addresses. U.S. addresses only.</p> <p>null The ZIP Code™ is a standard ZIP Code™.</p>
Principality.Result *	The largest geographic data element within a country
StateProvince.Result	<p>A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.</p> <p>C Corrected. U.S. addresses only.</p> <p>M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. Does not apply to U.S. or Canadian addresses.</p> <p>P Pass-through. The data was not used in the validation process, but it was preserved in the output. U.S. and Canadian addresses only.</p> <p>R The state is required but is missing from the input address. U.S. addresses only.</p> <p>S Standardized. This option includes any standard abbreviations. Does not apply to U.S. addresses.</p> <p>U Unmatched. Does not apply to Canadian addresses.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>
StreetAlias.Result	An alternate name for a street; typically applies only to a specific range of addresses on the street. If you do not allow street aliases in the output then the street's "base" name will appear in the output regardless of whether or not there is an alias for the street. The base name is the name that applies to the entire street. For example: If StreetName is "N MAIN ST" the StreetAlias field would contain "MAIN" and the thoroughfare type, "ST", would be returned in the StreetSuffix field.

columnName	Description
StreetName.Result	A Appended. The field was added to a blank input field. Canadian addresses only.
	C Corrected. U.S. and Canadian addresses only.
	F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.
	M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. U.S. addresses only.
	P Pass-through. The data was not used in the validation process, but it was preserved in the output. Does not apply to U.S. addresses.
	S Standardized. This option includes any standard abbreviations. U.S. and Canadian addresses only.
	V Validated. The data was confirmed correct and remained unchanged from input.
StreetSuffix.Result	A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.
	C Corrected. U.S. and Canadian addresses only.
	F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.
	M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. U.S. addresses only.
	P Pass-through. The data was not used in the validation process, but it was preserved in the output. Canadian addresses only.
	S Standardized. This option includes any standard abbreviations.
	V Validated. The data was confirmed correct and remained unchanged from input.
Subcity.Result*	A smaller population center data element, dependent on the contents of the Locality field. For instance, Turkish Neighbourhood .
Substreet.Result*	The dependent street or block data element within a country. For instance, UK Dependent Street .

columnName	Description
TrailingDirectional.Result	<p>A Appended. The field was added to a blank input field. U.S. and Canadian addresses only.</p> <p>C Corrected. U.S. and Canadian addresses only.</p> <p>F Formatted. The spacing and/or punctuation was changed to conform to postal standards. Does not apply to U.S. or Canadian addresses.</p> <p>M Multiple. The input address matched multiple records in the postal database, and each matching record has a different value in this field. U.S. addresses only.</p> <p>P Pass-through. The data was not used in the validation process, but it was preserved in the output. Canadian addresses only.</p> <p>S Standardized. This option includes any standard abbreviations.</p> <p>U Unmatched. Does not apply to Canadian addresses.</p> <p>V Validated. The data was confirmed correct and remained unchanged from input.</p>

*This is a subfield and may not contain data.

The AVC Code

The *Address Verification Code (AVC)* is an 11-byte code that is made up of accuracy indicators for addresses; the codes tell you the quality of the processing results and provide guidelines on how to correct the input data if necessary. Each individual address receives its own code. This code is automatically returned within your dataflow output. An example of an AVC is:

V44-I44-P6-100

An AVC has eight parts:

- Verification Status
- Post-Process Verification Match Level
- Pre-Process Verification Match Level
- Parsing Status
- Lexicon Identification Match Level
- Context Identification Match Level
- Postcode Status
- Matchscore

Verification Status

The level to which an address was verified.

- **V**—Verified. A complete match was made between the input data and a single record from the available reference data. For simple address validation, this is considered the best code to return.
- **P**—Partially verified. A partial match was made between the input data and a single record from the available reference data. This could mean that there is granular data for the address information that was provided, but additional information is required to return a full validation.
- **A**—Ambiguous. There are multiple addresses that could match the input.
- **U**—Unable to verify. This gets returned when there is not enough information to verify an address or when the input query is unreadable. The output fields will contain the input data.
- **R**—Reverted. The record could not be verified to the specified minimum acceptable level. This occurs when advanced options such as minimum reversion levels are set on a process. The output fields will contain the input data.
- **C**—Conflict. There is more than one close reference data match with conflicting values.

Post-Process Verification Match Level

The level to which the input data matches the available reference data after processing.

- **5**—Delivery point (building or post box). The record will be passed or will have high confidence if ApartmentNumber, HouseNumber, Street, City, and StateProvince supplied in the input record match to the Loqate reference dataset. Will have moderate confidence if ApartmentNumber is correct but other remaining fields are incorrect, but in this case the Loqate engine should be able to identify the ApartmentNumber as ApartmentNumber is at a more granular level. It will have zero confidence if ApartmentNumber and other fields are unable to be parsed by the Loqate engine.
- **4**—Premise or building. The record will be passed or will have high confidence if House Number, Street, City, and StateProvince supplied in the input record match the Loqate reference dataset. Will have moderate confidence if HouseNumber is correct but the other fields are not; however, in this case the Loqate engine should be able to identify the HouseNumber because HouseNumber is at a more granular level. It will have zero confidence if the HouseNumber and other fields are unable to be parsed by the Loqate engine.
- **3**—Thoroughfare, road, or street. The record will be passed or will have high confidence if Street, City, and StateProvince supplied in the input record match the Loqate reference dataset. Will have moderate confidence if City is correct but StateProvince is not; however, in this case the Loqate engine should be able to identify the StateProvince as City itself is the part of StateProvince. It will have zero confidence if City or both fields (City and State Province) are unable to be parsed by the Loqate engine.
- **2**—Locality (city or town). The record will be passed or will have high confidence if both City and StateProvince supplied in the input record match the Loqate reference dataset. Will have moderate confidence if City is correct but StateProvince is not; however, in this case the Loqate Engine should be able to identify the StateProvince as City itself is the part of StateProvince. It will have zero confidence if City or both fields (City and StateProvince) are unable to be parsed by the Loqate engine.
- **1**—Administrative area (state or region). The record will be passed or will have high confidence if the StateProvince supplied in the input record matches the Loqate reference dataset.
- **0**—None. This is equivalent to loosest match option.

Pre-Process Verification Match Level

The level to which the input data matches the available reference data before processing.

- **5**—Delivery point (building or post box)
- **4**—Premise or building.
- **3**—Thoroughfare, road, or street.
- **2**—Locality (city or town).
- **1**—Administrative area (state or region).
- **0**—None.

Parsing Status

The level to which an address was parsed.

- **I**—Identified and parsed. The input data has been identified and placed into components. For example, with "123 Kingston Av" Validate Address Loqate would be able to determine that "123" was a Premise Number, "Kingston" was the Thoroughfare Name, and "Av" or "Avenue" would be the Thoroughfare Type.
- **U**—Unable to parse. Validate Address Loqate was unable to identify and parse the input data. As with the "Unverified" verification status, the input data was incomplete or vague.

Lexicon Identification Match Level

The level to which the input data has some recognized form through the use of pattern matching (for instance, a numeric value could be a premise number) and lexicon matching (for example, "rd" could be Thoroughfare Type "road"; "London" could be a locality, and so on).

- **5**—Delivery point (building or post box)
- **4**—Premise or building.
- **3**—Thoroughfare, road, or street.
- **2**—Locality (city or town).
- **1**—Administrative area (state or region).
- **0**—None.

Context Identification Match Level

The level to which the input data can be recognized based on the context in which it appears. This is the least accurate form of matching and is based on identifying a word as a particular address element. For example, input could be determined to be a thoroughfare because it was preceded by something that could be a premise and followed by something that could be a locality, the latter items being identified through a match against the reference data or the lexicon.

- **5**—Delivery point (building or post box)
- **4**—Premise or building.
- **3**—Thoroughfare, road, or street.
- **2**—Locality (city or town).
- **1**—Administrative area (state or region).

- **0**—None.

Postcode Status

The level to which a postal code was verified.

- **P8**—PostalCodePrimary and PostalCodeSecondary verified.
- **P7**—PostalCodePrimary verified, PostalCodeSecondary added or changed.
- **P6**—PostalCodePrimary verified.
- **P5**—PostalCodePrimary verified with small change.
- **P4**—PostalCodePrimary verified with large change.
- **P3**—PostalCodePrimary added.
- **P2**—PostalCodePrimary identified by lexicon.
- **P1**—PostalCodePrimary identified by context.
- **P0**—PostalCodePrimary empty.

Match Score

A numeric value between 0 and 100 representing the similarity between the identified input data and the output data for the record. A result of 100 means that no changes other than additions, alias, casing, or diacritic changes have been made to the input data. A result of 0 means there is no similarity between the input data item and the output data provided.

AMAS Output

The following table lists the standard fields that are output by ValidateAddressLoqate.

Table 130: Output Fields

columnName	Description
Barcode	Standard barcode based on the DPID. F Failure (no barcode found) 20-digit number Success
DPID	The Delivery Point Identifier. An eight-digit number from the Australia Post Postal Address File that uniquely identifies a mail delivery point, such as a street address. Note: This field will contain "00000000" for Australian addresses that are not AMAS-verified and will be empty for non-Australian addresses.
FloorNumber	The floor/level number, for example: 123 E Main St Apt 3, 4th Floor

columnName	Description
FloorType	The floor/level type, for example: 123 E Main St Apt 3, 4th Floor
PostalBoxNum	The postal delivery number, for example: PO Box 42

Encountering False Positives

What is a False-Positive?

To prevent the generation of address lists, the DPV and LACS^{Link} databases include false-positive records. False-positive records are artificially manufactured addresses that reside in a false-positive table. For each negative response that occurs in a DPV or LACS^{Link} query, a query is made to the false-positive table. A match to this table (called a false-positive match) disables your DPV or LACS^{Link} key. In batch processing the job that contains the violation will complete successfully but you will not be able to run any subsequent jobs that use DPV or LACS^{Link} until you report the violation and obtain a key to reactivate DPV or LACS^{Link}.

Note: The term "seed record violation" is also used to refer to encountering false positive records. The two terms mean the same thing.

Reporting DPV False-Positive Violations

Spectrum™ Technology Platform indicates a false-positive match via messages in the server log. Client/server calls throw an exception if a false-positive match occurs. When a DPV false positive record violation occurs, the server log will say:

```
WARN [Log] Seed record violation for S<ZIP, ZIP+4, Address, Unit> ERROR
[Log] Feature Disabled: DPU: DPV Seed Record Violation. Seed Code:
S<Address, ZIP, ZIP+4, Unit>
```

Note: If a DPV false positive record is found, the process() method (COM, C++, Java, and .NET) will throw an exception that the feature DPU has been disabled. In C, the processMessage() function will return a non-zero value.

You can report the violation and obtain a restart key by following these steps.

1. In your browser, go to `http://<yourserver>:<port>/<product code>/dpv.jsp`. For example, `http://localhost:8080/unc/dpv.jsp` for the Universal Addressing Module and `http://localhost:8080/geostan/dpv.jsp` for the Enterprise Geocoding Module.

2. Enter the mailer's information into each field. The number in parentheses after each field name indicates the maximum length of the field.
3. Click **Submit** when you're done. A **File Download** dialog will appear.
4. Click **Save** to save the file to your computer. A **Save As** dialog will appear.
5. Specify a file name and location on your local hard drive (for example `c:\DPVSeedFile.txt`) and click **Save**.
6. Review the appropriate USPS information. For a DPV seed violation, review the USPS DPV Product Licensee Performance Requirements document at https://postalpro.usps.com/DPV_LPR.
7. Call Pitney Bowes Technical Support.

DPV False Positive Header File Layout

The USPS® has determined the required layout of the DPV false-positive header file, which is currently defined as a fixed-length file containing two or more 180-byte records. The first record must always be the header record, whose layout is shown below.

Table 131: DPV False-Positive Header Record Layout

Position	Length	Description	Format
1-40	40	Mailer's company name	Alphanumeric
41-98	58	Mailer's address line	Alphanumeric
99-126	28	Mailer's city name	Alphanumeric
127-128	2	Mailer's state abbreviation	Alphabetic
129-137	9	Mailer's 9-digit ZIP Code	Numeric
138-146	9	Total Records Processed	Numeric
147-155	9	Total Records DPV Matched	Numeric
156-164	9	Percent Match Rate to DSF	Numeric

Position	Length	Description	Format
165-173	9	Percent Match Rate to ZIP + 4®	Numeric
174-178	5	Number of ZIP Codes on file	Numeric
179-180	2	Number of False-Positives	Numeric

The trailer record contains information regarding the DPV false-positive match. There must be one trailer record added to the false-positive file for every DPV false-positive match. The layout is shown below.

Table 132: DPV False-Positive Trailer Record Layout

Position	Length	Description	Format
1-2	2	Street predirectional	Alphanumeric
3-30	28	Street name	Alphanumeric
31-34	4	Street suffix abbreviation	Alphanumeric
35-36	2	Street postdirectional	Alphanumeric
37-46	10	Address primary number	Alphanumeric
47-50	4	Address secondary abbreviation	Alphanumeric
51-58	8	Address secondary number	Numeric
59-63	5	Matched ZIP Code	Numeric

Position	Length	Description	Format
64-67	4	Matched ZIP + 4®	Numeric
68-180	113	Filler	Spaces

Reporting LACS/Link False-Positive Violations

Spectrum™ Technology Platform indicates a false-positive match via messages in the server log. Batch jobs will fail if a false-positive match occurs and client/server calls will throw an exception.

Note: The term "seed record violation" is also used to refer to encountering false positive records. The two terms mean the same thing.

When a false positive record is encountered, the server log will say:

```
2005-05-06 17:05:38,978 WARN [com.g1.component.ValidateAddress] Seed
record violation for RR 2 28562 31373
2005-05-06 17:05:38,978 ERROR [com.g1.component.ValidateAddress] Feature
Disabled: LLU: LACS Seed Record Violation. Seed Code: 28562 31373
2005-05-06 17:05:38,978 ERROR [com.g1.dcg.gateway.Gateway] Gateway
exception: com.g1.dcg.stage.StageException:
com.g1.dcg.component.ComponentException: Feature Disabled: LLU
2005-05-06 17:06:30,291 ERROR
[com.pb.spectrum.platform.server.runtime.core.license.impl.policy.Policy]
Feature LACSLink Real-time is disabled.
```

Note: If a LACS^{Link} false positive record is found, the process() method (COM, C++, Java, and .NET) will throw an exception that the feature LLU has been disabled. In C, the processMessage() function will return a non-zero value.

1. In your browser, go to `http://<ServerName>:<port>/<product code>/lacslink.jsp`. For example, `http://localhost:8080/unc/lacslink.jsp` for the Universal Addressing Module and `http://localhost:8080/geostan/lacslink.jsp` for the Enterprise Geocoding Module.
2. Enter the mailer's information into each field. The number in parentheses after the field name indicates the maximum length of the field. Click **Submit** when you're done. A **File Download** dialog will appear.
3. Click **Save** to save the file to your computer. A **Save As** dialog will appear.
4. Specify a file name and location on your local hard drive (for example `c:\lacslink.txt`) and click **Save**.
5. Review the appropriate USPS information. For a LACS^{Link} seed violation, review the LACS^{Link} End User Licensee Performance Requirements document at https://postalpro.usps.com/LL_EU_LPR.

- Call Pitney Bowes Technical Support.

ValidateAddress Confidence Algorithm

Introduction to the Validate Address Confidence Algorithm

ValidateAddress computes a confidence score for each validated address. This score describes how likely it is that the validated address is correct. Confidence code values range from 0 to 100, with a zero confidence level indicating no confidence and 100 indicating a very high level of confidence that the match results are correct. Confidence codes are calculated based on an algorithm that takes into account the match results for individual output fields. The output fields involved in this calculation include:

- Country
- City
- StateProvince
- PostalCode
- StreetName
- HouseNumber
- LeadingDirectional
- TrailingDirectional
- StreetSuffix
- ApartmentNumber

Each field has its own Weight in the algorithm. Additionally, for each field the match result could be labeled as Success, Failure, or Changed. ("Changed" refers to cases where the contents of the field have been corrected in order to get a match.) The match result—Success, Failure, or Changed—determines what the Factor is for that field. Thus, the calculation for the confidence code is a product of Weight by Factor as follows:

```
Confidence = (Weight * Factor) for City
+ (Weight * Factor) for Country
+ (Weight * Factor) for State
+ (Weight * Factor) for PostalCode
+ (Weight * Factor) for StreetName
+ (Weight * Factor) for HouseNumber
+ (Weight * Factor) for Directionals
+ (Weight * Factor) for Street Suffix
+ (Weight * Factor) for ApartmentNumber
```

Confidence Algorithm for U.S. and Canadian Addresses

The following table details the scoring and logic behind the ValidateAddress confidence algorithm for U.S. and Canadian addresses.

Table 133: Confidence Algorithm for U.S. and Canadian Addresses

Field	Weight/Match Score	Factor if Changed ³	Factor If Filled ⁴
Country	10	100%	0%
City	10	50%	75%
StateProvince	15	50%	75%
PostalCode	15	25%	25%
StreetName	15	50%	75%
HouseNumber	15	50%	75%
Directionals	10	50%	75%
StreetSuffix	5	50%	75%
ApartmentNumber	5	50%	75%

Confidence Algorithm for International Addresses

There are two confidence algorithms for addresses outside the U.S. and Canada, one for addresses in countries that use postal codes and one for addresses in countries that do not use postal codes.

The following table details the confidence algorithm for non-U.S. and non-Canadian addresses from countries that use postal codes.

⁴ Refers to instances when the input data in this field is not present but is filled in order to achieve a match.

³ Refers to instances when the input data in this field is changed in order to achieve a match.

Table 134: Confidence Algorithm for Countries With Postal Codes

Field	Weight/Match Score	Factor if Changed ⁵	Factor If Filled ⁶	Factor if Postal Data Unavailable
Country	11.11111111111111	100%	0%	0%
City	11.11111111111111	50%	75% ⁷	0%
StateProvince	16.66666666666667	100%	100	80%
PostalCode	16.66666666666667	100%	100%	80%
StreetName	16.66666666666667	50%	75%	50%
HouseNumber	16.66666666666667	50%	75%	50%
Directionals	0	50%	75%	0%
StreetSuffix	5.55555555555556	50%	75%	50%
ApartmentNumber	5.55555555555556	50%	75%	50%

⁶ Refers to instances when the input data in this field is not present but is filled in order to achieve a match.

⁵ Refers to instances when the input data in this field is changed in order to achieve a match.

⁷ If the country is a Category C country, this value is 50%. Countries fall into one of these categories:

- **Category A**—Enables the validation and correction of an address's postal code, city name, state/county name, street address elements, and country name.
- **Category B**—Enables the validation and correction of an address's postal code, city name, state/county name, and country name. It does not support the validation or correction of street address elements.
- **Category C**—Enables the validation and correction of the country name, and the validation of the format of the postal code.

The following table details confidence algorithm for countries that do not use postal codes.

Table 135: Confidence Algorithm for Countries Without Postal Codes

Field	Weight/Match Score	Factor if Changed ⁸	Factor If Filled ⁹	Factor if Postal Data Unavailable
Country	13.33333333333333	100%	0%	0%
City	13.33333333333333	50%	75% ¹⁰	0%
StateProvince	20	100%	100	80%
StreetName	20	50%	75%	50%
HouseNumber	20	50%	75%	50%
Directionals	0	50%	75%	0%
StreetSuffix	6.66666666666667	50%	75%	50%
ApartmentNumber	6.66666666666667	50%	75%	50%

⁹ Refers to instances when the input data in this field is not present but is filled in order to achieve a match.

⁸ Refers to instances when the input data in this field is changed in order to achieve a match.

¹⁰ If the country is a Category C country, this value is 50%. Countries fall into one of these categories:

- **Category A**—Enables the validation and correction of an address's postal code, city name, state/county name, street address elements, and country name.
- **Category B**—Enables the validation and correction of an address's postal code, city name, state/county name, and country name. It does not support the validation or correction of street address elements.
- **Category C**—Enables the validation and correction of the country name, and the validation of the format of the postal code.

The following table lists countries without postal codes.

Table 136: Countries Without Postal Codes

Afghanistan	Albania	Angola
Anguilla	Bahamas	Barbados
Belize	Benin	Bhutan
Botswana	Burkina Faso	Burundi
Cameroon	Cayman Islands	Central African Rep.
Chad	Cocos Islands	Colombia
Comoros	Congo (Dem. Rep.)	Congo (Rep.)
Cote d'Ivoire	Korea (North)	Djibouti
Dominica	Equatorial Guinea	Eritrea
Fiji	Gabon	Gambia
Ghana	Grenada	Guyana
Ireland	Jamaica	Kiribati
Libya	Malawi	Mali
Mauritania	Namibia	Nauru

Palau	Panama	Peru
Qatar	Rwanda	Saint Lucia
Saint Vincent and the Grenadines	Samoa	Sao Tome and Principe
Seychelles	Sierra Leone	Suriname
Tanzania	Timor	Togo
Tonga	Trinidad & Tobago	Tuvalu
Uganda	United Arab Emirates	Vanuatu
Yemen	Zimbabwe	

Universal Name Module

OpenNameParser

OpenNameParser breaks down personal and business names and other terms in the name data field into their component parts. These parsed name elements are then subsequently available to other automated operations such as name matching, name standardization, or multiple-record name consolidation.

OpenNameParser does the following:

- Determines the type of a name in order to describe the function that the name performs. Name entity types are divided into two major groups: personal names and business names. Within each of these major groups are subgroups.

- Determines the form of a name in order to understand which syntax the parser should follow for parsing. Personal names usually take on a natural (signature) order or a reverse order. Business names are usually ordered hierarchically.
- Determines and labels the component parts of a name so that the syntactical relationship of each name part to the entire name is identified. The personal name syntax includes prefixes, first, middle, and last name parts, suffixes, and account description terms, among other personal name parts. The business name syntax includes the firm name and suffix terms.
- Parses conjoined personal and business names and either retains them as one record or splits them into multiple records. Examples of conjoined names include "Mr. and Mrs. John Smith" and "Baltimore Gas & Electric dba Constellation Energy".
- Parses output as records or as a list.
- Assigns a parsing score that reflects the degree of confidence that the parsing is correct.

Input

Table 137: Open Name Parser Input

columnName	Description								
CultureCode	<p>The culture of the input name data. The options are listed below.</p> <table border="0"> <tr> <td>Null (empty)</td> <td>Global culture (default).</td> </tr> <tr> <td>de</td> <td>German.</td> </tr> <tr> <td>es</td> <td>Spanish.</td> </tr> <tr> <td>ja</td> <td>Japanese.</td> </tr> </table> <p>Note: If you added your own domain using the Open Parser Domain Editor, the cultures and culture codes for that domain are also valid.</p>	Null (empty)	Global culture (default).	de	German.	es	Spanish.	ja	Japanese.
Null (empty)	Global culture (default).								
de	German.								
es	Spanish.								
ja	Japanese.								
Name	The name you want to parse. This field is required.								

Options

OpenNameParser options can be configured at the stage level, through any of the Spectrum™ Technology Platform clients, or at runtime, using dataflow options.

Parsing Options

The following table lists the options that control the parsing of names.

Table 138: Open Name Parser Parsing Options

optionName	Description
ParseNaturalOrderPersonalNames	Specifies whether to parse names where the is in the order Title, First Name, Middle Name, Last Name, and Suffix.
	<p>true Parse personal names that are in natural order.</p> <p>false Do not parse names that are in natural order.</p>
ParseReverseOrderPersonalNames	Specifies whether to parse names where the last name is specified first.
	<p>true Parse personal names that are in reverse order.</p> <p>false Do not parse names that are in reverse order.</p>
ParseConjoinedNames	Specifies whether to parse conjoined names.
	<p>true Parse conjoined names.</p> <p>false Do not parse conjoined names.</p>
SplitConjoinedNames	Specifies whether to separate names containing more than one individual into multiple records, for example, Bill & Sally Smith.
	<p>true Split conjoined names.</p> <p>false Do not split conjoined names.</p>
ParseBusinessNames	Specifies whether to parse business names.
	<p>true Parse business names.</p> <p>false Do not parse business names.</p>

optionName	Description
OutputAsList	<p>Specifies whether to return the parsed name elements in a list form.</p> <p>true Return the parsed elements in a list form.</p> <p>false Do not return the parsed elements in a list form.</p>
ShortcutThreshold	<p>Specifies how to balance performance versus quality. A faster performance will result in lower quality output; likewise, higher quality will result in slower performance. When this threshold is met, no other processing will be performed on the record.</p> <p>Specify a value from 0 to 100. The default is 100.</p>

Cultures Options

The following table lists the options that control name cultures.

Table 139: Open Name Parser Cultures Options

optionName	Description
DefaultCulture	<p>Specifies which culture(s) you want to include in the parsing grammar. Global Culture is the default selection.</p> <p>Specify cultures by specifying the two-character culture code in a comma-separated list in priority order. For example, to attempt to parse the name using the Spanish culture first then Japanese, you would specify:</p> <p><code>es, ja, ,</code></p>

Advanced Options

The following table lists the advanced options for name parsing.

Table 140: Open Name Parser Advanced Options

Option	Description
NaturalOrderPersonalNamesDomain	Specifies the domain to use when parsing natural order personal names. The valid values are the domain names defined in the Open Parser Domain Editor too in Enterprise Designer.
NaturalOrderPersonalNamesPriority	<p>Specify a number between 1 and 5 that indicates the priority of the natural order personal names domain relative to the other domains that you are using. This determines the order in which you want the parsers to run.</p> <p>Results will be returned for the first domain that scores higher than the number set in the shortcut threshold option. If no domain reaches that threshold, results for the domain with the highest score are returned. If multiple domains reach the threshold at the same time, priority goes to the domain that was run first (determined by the order set here) and its results will be returned.</p>
ReverseOrderPersonalNamesDomain	Specifies the domain to use when parsing reverse order personal names. The valid values are the domain names defined in the Open Parser Domain Editor too in Enterprise Designer.
ReverseOrderPersonalNamesPriority	<p>Specify a number between 1 and 5 that indicates the priority of the reverse order personal names domain relative to the other domains that you are using. This determines the order in which you want the parsers to run.</p> <p>Results will be returned for the first domain that scores higher than the number set in the shortcut threshold option. If no domain reaches that threshold, results for the domain with the highest score are returned. If multiple domains reach the threshold at the same time, priority goes to the domain that was run first (determined by the order set here) and its results will be returned.</p>
NaturalOrderConjoinedPersonalNamesDomain	Specifies the domain to use when parsing natural order conjoined personal names. The valid values are the domain names defined in the Open Parser Domain Editor too in Enterprise Designer.

Option	Description
NaturalOrderConjoinedPersonalNamesPriority	<p>Specify a number between 1 and 5 that indicates the priority of the natural order conjoined personal names domain relative to the other domains that you are using. This determines the order in which you want the parsers to run.</p> <p>Results will be returned for the first domain that scores higher than the number set in the shortcut threshold option. If no domain reaches that threshold, results for the domain with the highest score are returned. If multiple domains reach the threshold at the same time, priority goes to the domain that was run first (determined by the order set here) and its results will be returned.</p>
ReverseOrderConjoinedPersonalNamesDomain	<p>Specifies the domain to use when parsing reverse order conjoined personal names. The valid values are the domain names defined in the Open Parser Domain Editor too in Enterprise Designer.</p>
ReverseOrderConjoinedPersonalNamesPriority	<p>Specify a number between 1 and 5 that indicates the priority of the reverse order conjoined personal names domain relative to the other domains that you are using. This determines the order in which you want the parsers to run.</p> <p>Results will be returned for the first domain that scores higher than the number set in the shortcut threshold option. If no domain reaches that threshold, results for the domain with the highest score are returned. If multiple domains reach the threshold at the same time, priority goes to the domain that was run first (determined by the order set here) and its results will be returned.</p>
BusinessNamesDomain	<p>Specifies the domain to use when parsing business names. The valid values are the domain names defined in the Open Parser Domain Editor too in Enterprise Designer.</p>

Option	Description
BusinessNamesPriority	<p>Specify a number between 1 and 5 that indicates the priority of the business names domain relative to the other domains that you are using. This determines the order in which you want the parsers to run.</p> <p>Results will be returned for the first domain that scores higher than the number set in the shortcut threshold option. If no domain reaches that threshold, results for the domain with the highest score are returned. If multiple domains reach the threshold at the same time, priority goes to the domain that was run first (determined by the order set here) and its results will be returned.</p>

Configuring Options at Runtime

OpenNameParser options can be configured and passed at runtime if they are exposed as dataflow options. This enables you to override the existing configuration with JSON-formatted name parsing strings. You can also set stage options when calling the job through a process flow or through the job executor command-line tool.

To define OpenNameParser options at runtime:

1. In Enterprise Designer, open a dataflow that uses the Open Name Parser stage.
2. Save and expose that dataflow.
3. Go to `Edit > Dataflow Options`.
4. In the **Map dataflow options to stages** table, expand Open Name Parser and edit options as necessary. Check the box for the option you want to edit, then change the value in the **Default value** drop-down.
5. Optional: Change the name of the options in the **Option label** field.
6. Click **OK** twice.

Output

Table 141: Open Name Parser Output

columnName	Format	Description
AccountDescription	String	An account description that is part of the name. For example, in "Mary Jones Account # 12345", the account description is "Account#12345".

columnName	Format	Description
Names	String	A hierarchical field that contains a list of parsed elements. This field is returned when you check the Output results as list box under Parsing Options.

Fields Related to Names of Companies

FirmConjunction	String	Indicates that the name of a firm contains a conjunction such as "d/b/a" (doing business as), "o/a" (operating as), and "t/a" (trading as).
FirmName	String	The name of a company. For example, "Pitney Bowes".
FirmSuffix	String	The corporate suffix. For example, "Co." and "Inc."
IsFirm	String	Indicates that the name is a firm rather than an individual.

Fields Related to Names of Individual People

Conjunction	String	Indicates that the name contains a conjunction such as "and", "or", or "&".								
CultureCode	String	The culture codes contained in the input data.								
CultureCodeUsedToParse	String	Identifies the culture-specific grammar that was used to parse the data. <table border="0" style="margin-left: 20px;"> <tr> <td>Null (empty)</td> <td>Global culture (default).</td> </tr> <tr> <td>de</td> <td>German.</td> </tr> <tr> <td>es</td> <td>Spanish.</td> </tr> <tr> <td>ja</td> <td>Japanese.</td> </tr> </table> <p>Note: If you added your own domain using the Open Parser Domain Editor, the cultures and culture codes for that domain will appear in this field as well.</p>	Null (empty)	Global culture (default).	de	German.	es	Spanish.	ja	Japanese.
Null (empty)	Global culture (default).									
de	German.									
es	Spanish.									
ja	Japanese.									

columnName	Format	Description
FirstName	String	The first name of a person.
GeneralSuffix	String	A person's general/professional suffix. For example, MD or PhD.
IsParsed	String	Indicates whether an output record was parsed. Values are true or false.
IsPersonal	String	Indicates whether the name is an individual rather than a firm. Values are true or false.
IsReverseOrder	String	Indicates whether the input name is in reverse order. Values are true or false.
LastName	String	The last name of a person. Includes the paternal last name.
LeadingData	String	Non-name information that appears before a name.
MaturitySuffix	String	A person's maturity/generational suffix. For example, Jr. or Sr.
MiddleName	String	The middle name of a person.
Name.	String	The personal or firm name that was provided in the input.
NameScore	String	Indicates the average score of known and unknown tokens for each name. The value of NameScore will be between 0 and 100, as defined in the parsing grammar. 0 is returned when no matches are returned.
SecondaryLastName	String	In Spanish parsing grammar, the surname of a person's mother.
TitleOfRespect	String	Information that appears before a name, such as "Mr.", "Mrs.", or "Dr."

columnName	Format	Description
TrailingData	String	Non-name information that appears after a name.
Fields Related to Conjoined Names		
Conjunction2	String	Indicates that a second, conjoined name contains a conjunction such as "and", "or", or "&".
Conjunction3	String	Indicates that a third, conjoined name contains a conjunction such as "and", "or", or "&".
FirmName2	String	The name of a second, conjoined company. For example, Baltimore Gas & Electric dba Constellation Energy.
FirmSuffix2	String	The suffix of a second, conjoined company.
FirstName2	String	The first name of a second, conjoined name.
FirstName3	String	The first name of a third, conjoined name.
GeneralSuffix2	String	The general/professional suffix for a second, conjoined name. For example, MD or PhD.
GeneralSuffix3	String	The general/professional suffix for a third, conjoined name. For example, MD or PhD.
IsConjoined	String	Indicates that the input name is conjoined. An example of a conjoined name is "John and Jane Smith."
LastName2	String	The last name of a second, conjoined name.

columnName	Format	Description
LastName3	String	The last name of a third, conjoined name.
MaturitySuffix2	String	The maturity/generational suffix for a second, conjoined name. For example, Jr. or Sr.
MaturitySuffix3	String	The maturity/generational suffix for a third, conjoined name. For example, Jr. or Sr.
MiddleName2	String	The middle name of a second, conjoined name.
MiddleName3	String	The middle name of a third, conjoined name.
TitleOfRespect2	String	Information that appears before a second, conjoined name, such as "Mr.", "Mrs.", or "Dr."
TitleOfRespect3	String	Information that appears before a third, conjoined name, such as "Mr.", "Mrs.", or "Dr."

8 - About Spectrum™ Technology Platform

In this section

What Is Spectrum™ Technology Platform?	772
Enterprise Data Management Architecture	773
Spectrum™ Technology Platform Architecture	776
Modules and Components	781

What Is Spectrum™ Technology Platform?

Spectrum™ Technology Platform is a system that improves the completeness, validity, consistency, timeliness, and accuracy of your data through data standardization, verification and enhancement. Ensuring that your data is accurate, complete, and up to date enables your firm to better understand and connect with your customers.

Spectrum™ Technology Platform aids in the design and implementation of business rules for data quality by performing the functions described here.

Parsing, Name Standardization, and Name Validation

To perform the most accurate standardization you may need to break up strings of data into multiple fields. Spectrum™ Technology Platform provides advanced parsing features that enable you to parse personal names, company names, and many other terms and abbreviations. In addition, you can create your own list of custom terms to use as the basis of scan and extract operations. The Universal Name Module provides this functionality.

Deduplication and Consolidation

Identifying unique entities enables you to consolidate records, eliminate duplicates and develop "best-of-breed" records. A "best-of-breed" record is a composite record that is built using data from other records. The Advanced Matching Module and Data Normalization Module provide this functionality.

Address Validation

Address validation applies rules from the appropriate postal authority to put an address into a standard form and even validate that the address is a deliverable address. Address validation can help you qualify for postal discounts and can improve the deliverability of your mail. The Universal Addressing Module provides this functionality.

Geocoding

Geocoding is the process of taking an address and determining its geographic coordinates (latitude and longitude). Geocoding can be used for map generation, but that is only one application. The underlying location data can help drive business decisions. Reversing the process, you can enter a geocode (a point represented by a latitude and longitude coordinate) and receive address information about the geocode. The Enterprise Geocoding Module provides this functionality.

Location Intelligence

Location intelligence creates new information about your data by assessing, evaluating, analyzing and modeling geographic relationships. Using location intelligence processing you can verify locations

and transform information into valuable business intelligence. The Spatial Module provides this functionality.

Master Data Management

Master data management enables you to create relationship-centric master data views of your critical data assets. The Data Hub Module helps you identify influencers and non-obvious relationships, detect fraud, and improve the quality, integration, and accessibility of your information.

Tax Jurisdiction Assignment

Tax jurisdiction assignment takes an address and determines the tax jurisdictions that apply to the address's location. Assigning the most accurate tax jurisdictions can reduce financial risk and regulatory liability.

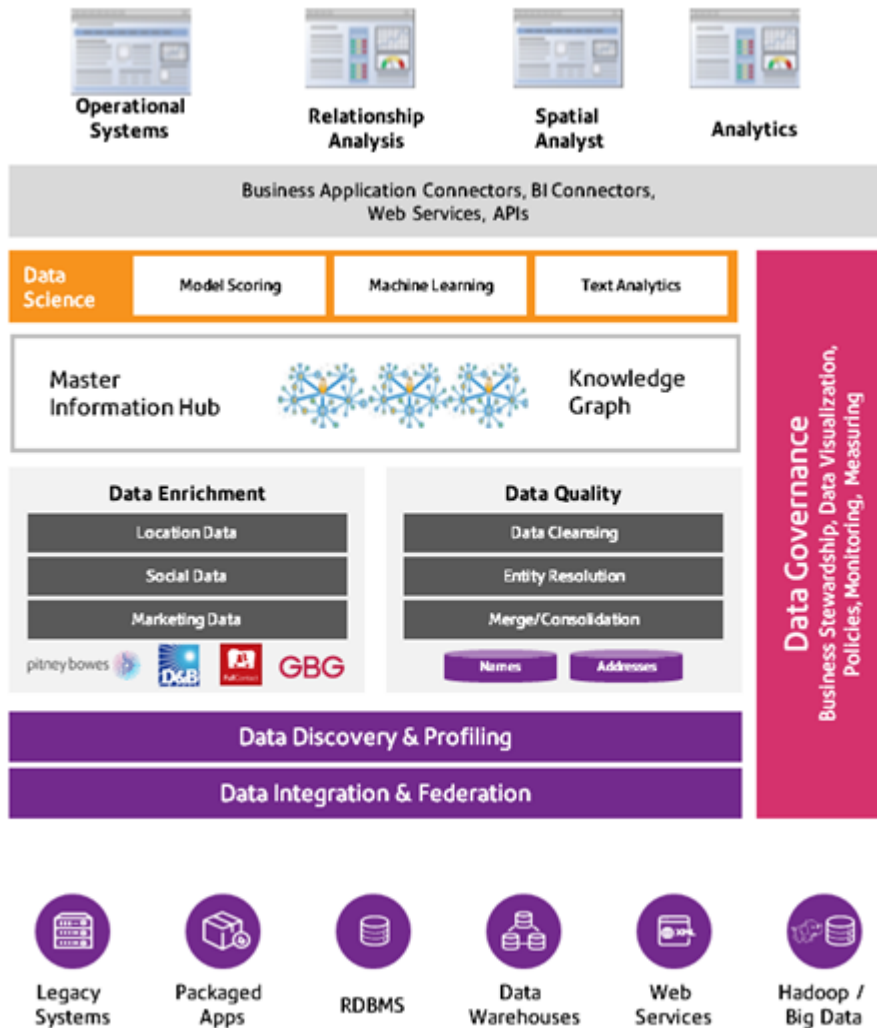

Spectrum™ Technology Platform software from Pitney Bowes integrates up-to-date jurisdictional boundaries with the exact street addresses of your customer records, enabling you to append the correct state, county, township, municipal, and special tax district information to your records. Some example uses of tax jurisdiction assignment are:

- Sales and use tax
- Personal property tax
- Insurance premium tax

The Enterprise Tax Module provides this functionality.

Enterprise Data Management Architecture

With Spectrum™ Technology Platform, you can build a comprehensive enterprise data management process, or you can use it as a more targeted solution. This diagram illustrates a complete solution that takes data from its source, through data enrichment and data quality processes, feeding a master data management hub which makes a single view of the data available to multiple business applications.

Master Information Hub

The Master Information Hub hub allows for rapid modeling of entities and their complex relationships across roles, processes, and interactions. It provides built-in social network analysis capabilities to help you understand influencers, predict churn, detect non-obvious relationships and fraudulent patterns, and provide recommendations.

Spectrum™ Technology Platform supports two approaches to the MDM hub. In the master hub approach, the data is maintained in a single MDM database and applications access the data from the MDM database. In the registry approach, the data is maintained in each business application and the MDM hub registry contains keys which are used to find related records. For example, a customer's record may exist in an order entry database and a customer support database. The MDM registry would contain a single key which could be used to access the customer data in both places.

Data Enrichment

Data enrichment processes augment your data with additional information. You can base enrichment on spatial data, marketing data, or data from other detail sources. For example, if you have a database of customer addresses, you could geocode the address to determine the latitude/longitude coordinates of the address and store those coordinates as part of the record. You can then use your customer data to perform a variety of spatial calculations, such as finding the customer's nearest bank branch. Spectrum™ Technology Platform allows you to enrich your data with a variety of information, including geocoding (with the Enterprise Geocoding Module), tax jurisdiction assignment (with the Enterprise Tax Module), geospatial calculations (with the Spatial Module), and travel directions between points (with the Spatial Module).

Data Quality and Data Governance

Data quality and data governance processes check your data for duplicate records, inconsistent information, and inaccurate information.

Duplicate matching identifies potential duplicate records or relationships between records, whether the data is name and address in nature or any other type of customer information. Spectrum™ Technology Platform allows you to specify a consistent set of business match rules using Boolean matching methods, scoring methods, thresholds, algorithms, and weights to determine if a group of records contains duplicates. Spectrum™ Technology Platform supports extensive customization so you can tailor the rules to the unique needs of your business.

Once duplicate records have been identified, you may wish to consolidate records. Spectrum™ Technology Platform allows you to specify how to link or merge duplicate records so you can create the most accurate and complete record from any collection of customer information. For example, you can build a single best-of-breed record from all of the records in a household. The Advanced Matching Module is used to identify duplicates and eliminate them.

Data quality processes also standardize your data. Standardization is a critical process because standardized data elements are necessary to achieve the highest possible results for matching and identifying relationships between records. While several modules perform standardization of one type or another, the Spectrum™ Technology Platform Data Normalization module provides the most comprehensive set of standardization features. In addition, the Universal Name module provides specific data quality features for handling personal name and business name data.

Standardized data is not necessarily accurate data. Spectrum™ Technology Platform can compare your data to known, up-to-date reference data for correctness. The sources used for this process may include regulatory bodies such as the U.S. Postal Service, third-party data providers such as Experian or Dunn and Bradstreet, or your company's internal reference sources, such as accounting data. Spectrum™ Technology Platform is particularly strong in address data validation. It can validate or standardize addresses in 250 countries and territories around the world. The Universal Addressing Module performs address validation.

To determine which one is right for you, discuss your needs with your account executive.

While Spectrum™ Technology Platform can automatically handle a wide range of data quality issues, there are some situations where a manual review by a data steward is appropriate. To support this, the Business Steward Module provides a way to specify the rules that will trigger a manual review,

and it provides a web-enabled tool for reviewing exception records. It includes integrated access to third-party tools such as Bing maps and Experian data to aid data stewards in the review and resolution process.

Data Discovery and Profiling

Data discovery is the process of scanning your data resources to get a complete inventory of your data landscape. Spectrum™ Technology Platform can scan structured data, unstructured data, and semi-structured data using a wide array of data profiling techniques. The results of the scan are used to automatically generate a library of documentation describing your company's data assets and to create a metadata repository. This documentation and accompanying metadata repository provide the insight you need before beginning data integration, data quality, data governance, or master data management projects.

For more information about the Spectrum™ Technology Platform Data Discovery Module, contact your account executive.

Data Integration and Federation

Once you have an inventory of your data landscape, you need to consider how you will access the data you need to manage. Spectrum™ Technology Platform can connect to data in multiple sources either directly or through integration with your existing data access technologies. It supports batch and real-time data integration capabilities for a variety of business needs, including data warehousing, data quality, systems integration, and migration. Spectrum™ Technology Platform can access data in RDBMS databases, data warehouses, XML files, flat files, and more. Spectrum™ Technology Platform supports SQL queries with complex joins and aggregations and provides a visual query development tool. In addition, Spectrum™ Technology Platform can access data over REST and SOAP web services.

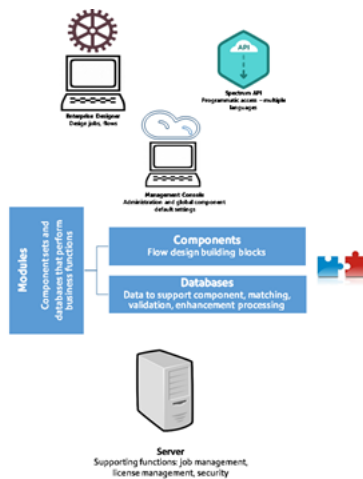

Spectrum™ Technology Platform can trigger batch processing based on the appearance of one or more source files in a specified folder. This "hot folder" trigger is useful for monitoring FTP uploads and processing them as they occur.

Some of these data integration capabilities require a license for the Enterprise Data Integration Module. For more information, contact your account executive.

Finally, Spectrum™ Technology Platform can integrate with packaged applications such as SAP.

Spectrum™ Technology Platform Architecture

Spectrum™ Technology Platform from Pitney Bowes consists of a server that runs a number of modules. These modules provide different functions, such as address validation, geocoding, and advanced parsing, among others. This diagram illustrates the Spectrum™ Technology Platform architecture.

Server

The foundation of the Spectrum™ Technology Platform is the server. The server handles data processing, synchronizes repository data, and manages communication. It provides job management and security features.

Modules

Modules are sets of features that perform a specific function. For example, the Universal Addressing Module standardizes addresses to conform to postal standards. The Enterprise Tax Module determines the tax jurisdictions that apply to a given address. Modules are grouped together to solve common business problems and licensed together as bundles.

Components

Modules are comprised of components which perform a specific function in a flow or as a service. For example, the Enterprise Geocoding module's Geocode US Address component takes an address and returns the latitude and longitude coordinates for that address; the Universal Addressing module's Get City State Province takes a postal code and returns the city and state or province where that postal code is located.

The components that you have available on your system depend on which Spectrum™ Technology Platform bundle you have licensed.

Databases

Some modules depend on databases containing reference data. For example, the Universal Addressing module needs to have access to U.S. Postal Service data in order to verify and standardize addresses in the U.S. Databases are installed separately and some are updated on a regular basis to provide you with the latest data.

Modules have both required and optional databases. Optional databases provide data needed for certain features that can enhance your Spectrum™ Technology Platform process.

Management Console

Management Console is a tool for administering Spectrum™ Technology Platform. You can use Management Console to:

- Define the connections between Spectrum™ Technology Platform and your data
- Specify the default settings for services and flows
- Manage user accounts, including permissions and passwords
- View logs
- View licenses including license expiration information

Enterprise Designer

Enterprise Designer is a tool for creating Spectrum™ Technology Platform jobs, services, subflows, and process flows. It provides a familiar drag-and-drop interface to allow you to graphically create complex flows.

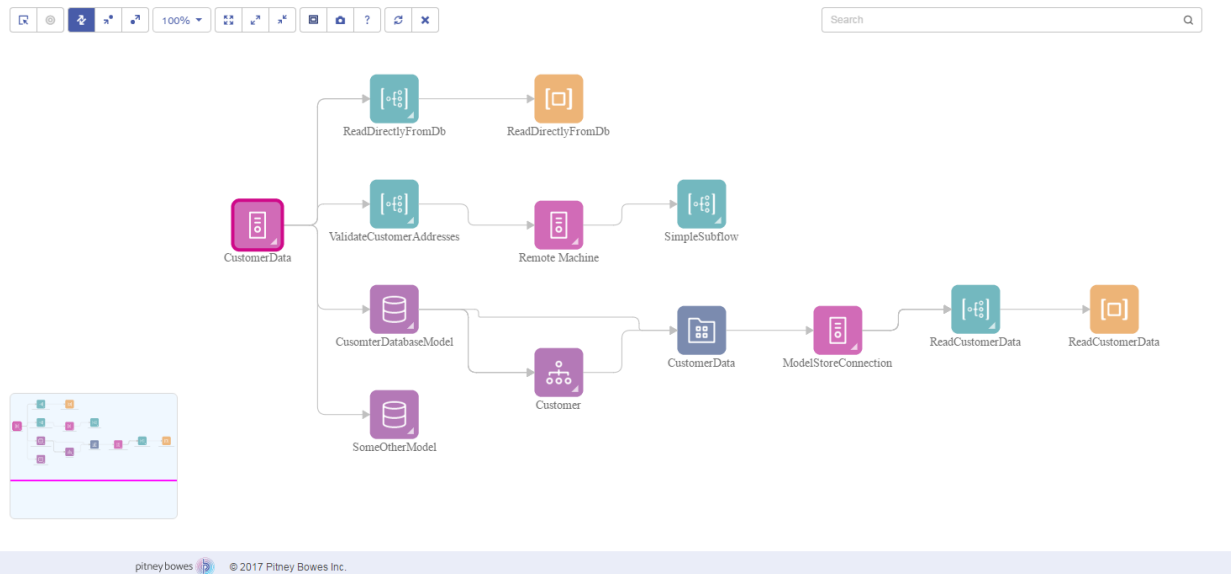

Note: Enterprise Designer will be replaced by Flow Designer in a future release. Flow Designer is in Technical Preview status at this time.

Metadata Insights

Metadata Insights gives you the control you need to deliver accurate and timely data-driven insights to your business. Use Metadata Insights to develop data models, view the flow of data from source to business application, and assess the quality of your data through profiling. With this insight, you can identify the data resources to use to answer particular business questions, adapt and optimize processes to improve the usefulness and consistency of data across your business, and troubleshoot data issues.

Home > Lineage & Impact Analysis

Lineage & Impact Analysis

Web Services and API

You can integrate Spectrum™ Technology Platform capabilities into your applications using web services and programming APIs. These interfaces provide simple integration, streamline record processing, and support backward compatibility of future versions.

The Spectrum™ Technology Platform API is available for these languages:

- C
- C++
- COM
- Java
- .NET

Web services are available via SOAP and REST.

Administration Utility - Command Line Interface (CLI)

The Administration Utility provides command line access to administrative functions. You can run commands interactively or in scripts. Some administrative functions are not available in the Administration Utility. For these functions, you can use Management Console as well as some component applications.

Modules and Components

ISO Country Codes and Module Support

This table lists the ISO codes for each country as well as the modules that support addressing, geocoding, and routing for each country.

Note that the Enterprise Geocoding Module includes databases for Africa (30 countries), Middle East (8 countries) and Latin America (20 countries). These databases cover the smaller countries in those regions that do not have their own country-specific geocoding databases. The Supported Modules column indicates which countries are covered by these Africa, Middle East, and Latin America databases.

Also, the Geocode Address World database provides geographic and limited postal geocoding (but not street-level geocoding) for all countries.
